April 2005

Santa Clara Valley Transportation Authority. 2005. *Environmental Impact Report for the Capitol Expressway Corridor*. Volume III of III: Appendices A through J. State Clearinghouse #2001092014. Final. April. (J&S 01-277.) San Jose, CA.

Contents

| | |
|--------------------------|--------------------------------------------------------------------------------------------|
| VOLUME I | EIR TEXT (BOUND SEPARATELY) |
| VOLUME II | RECOMMENDED LIGHT RAIL ALTERNATIVE AND RESPONSES TO COMMENTS (BOUND SEPARATELY) |
| VOLUME III | TECHNICAL APPENDICES |
| Appendix A | Light Rail Alternative Alignment |
| Appendix B | Transportation Study, Capitol Expressway Light Rail Corridor |
| Appendix B (Addendum) | Constructing Light Rail and Maintaining High-Occupancy Vehicle Lanes |
| Appendix C | Patronage Report, Downtown East Valley Capitol Expressway Corridor |
| Appendix D | Air Quality Technical Information |
| Appendix E | Biological Resources Information |
| Appendix E-1 | Special-Status Species Tables |
| Appendix E-2 | U.S. Fish and Wildlife Service Correspondence |
| Appendix E-3 | National Marine Fisheries Service Correspondence |
| Appendix E-4 | California Natural Diversity Database Search Results |
| Appendix E-5 | Biological Resources Survey Technical Memorandum |
| Appendix E-6 | Relevant Plans and Policies for Biological Resources |
| Appendix F | Geotechnical Investigation Report |
| Appendix G | Hazardous Materials Assessment |
| Appendix H | Relevant Land Use Plans and Policies |

Appendix I Noise and Vibration Technical Report

Appendix J Consultation and Coordination

Appendix A

Light Rail Alternative Alignment

These alignment drawings depict the Light Rail Alternative as discussed in the Draft EIS/EIR. Volume II, Chapter 2, Attachment A depicts the Recommended Light Rail Alternative that was approved by the Downtown East Valley Policy Advisory Board on August 5, 2004.

1.0 INTRODUCTION

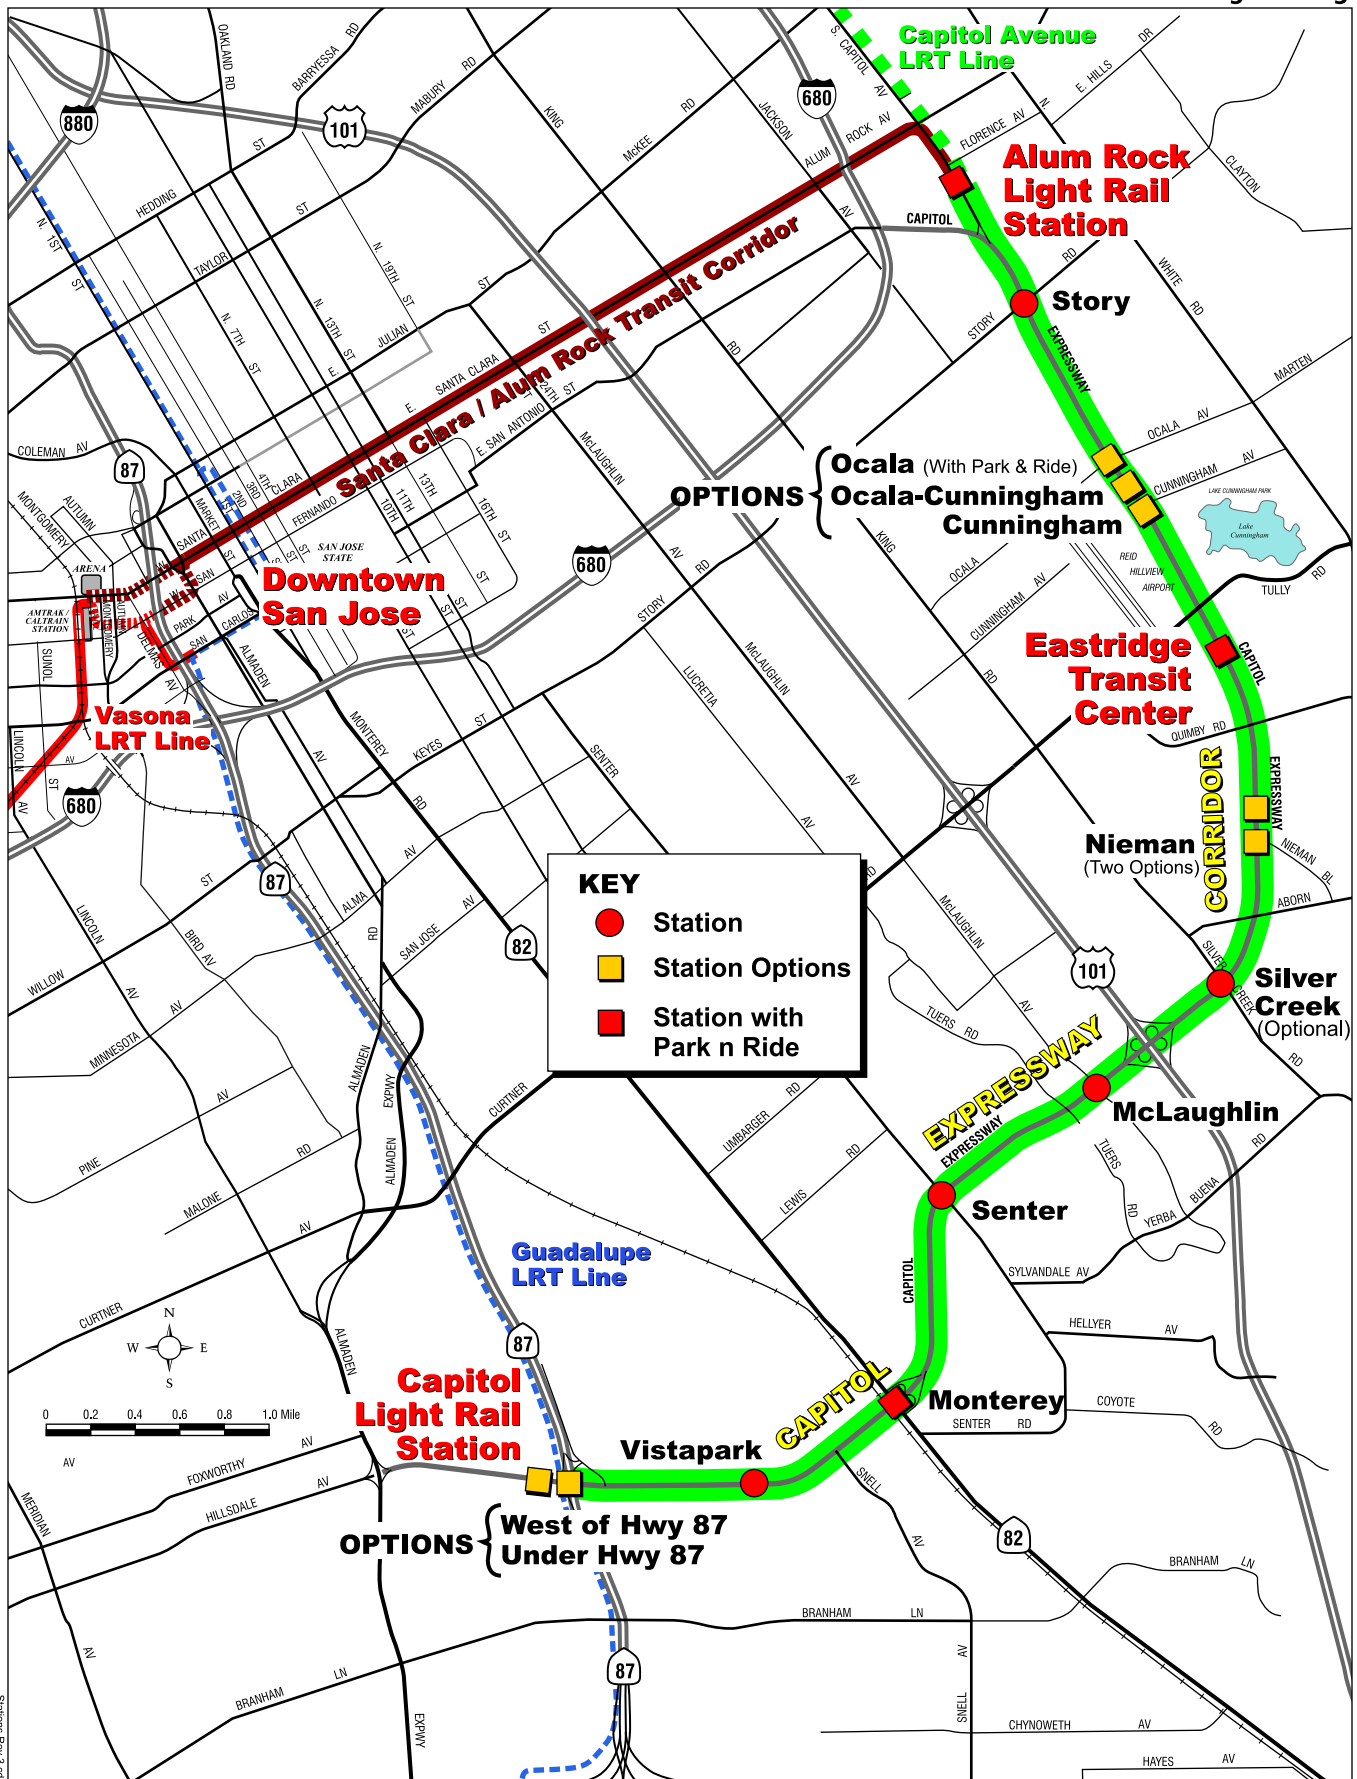

The Santa Clara Valley Transportation Authority (VTA) proposes to extend light rail transit service in the Downtown/East Valley corridor. The Proposed Project is an extension of light rail transit along Capitol Expressway, between Capitol Avenue and State Route 87 (SR 87). This report provides an evaluation of traffic and transportation related issues related to the Proposed Project. This report summarizes the existing transportation conditions along Capitol Expressway and outlines the impacts of the Proposed Project on the local and regional transportation network. The report addresses roadway, automobile traffic, transit (including bus, light rail and commuter rails), pedestrians, bicycle facilities, goods movement, parking, and community access.

1.1 Project Overview & Alignment

The proposed LRT line is an 8.2 mile extension of the Tasman East/Capitol Light Rail Line, currently under construction. The line begins on Capitol Avenue at Wilbur Avenue, enters Capitol Expressway at Capitol Avenue, and continues along the remaining portion of Capitol Expressway to a terminus at SR 87. Figure 1-1 shows the location of the project and the proposed stations.

The Proposed Project would add up to 10 new stations along its length as noted on Figure 1-1. Once the Tasman East/Capitol Light Rail Line and the Capitol Expressway Light Rail Line are completed, there will be a continuous 26-mile long light rail line that would run from south and east San Jose through North San Jose and the Cities of Milpitas, Santa Clara, Sunnyvale, and Mountain View to the Mountain View Caltrain/Light Rail Station. In North San Jose there will be a transfer point at the Baypointe/Tasman Station connecting this corridor and the existing Guadalupe Light Rail Line. Figure 1-2 presents a schematic view of the LRT operations and the respective existing segments and segments under development. The figure shows the LRT extension to Campbell that is also under construction along the Union Pacific Railroad (UPRR) Vasona branch, and referred to as the Vasona Light Rail Line. Also noted on Figure 1-2 is the extension of the Tasman East/Capitol Avenue Light Rail Line along Capitol Avenue to the Alum Rock station. The graphic indicates that the Capitol Expressway Light Rail Line would operate as a continuous route from Mountain View to SR 87. Figure 1-2 also illustrates a transit connection from downtown to the East Valley along Santa Clara Street and Alum Rock Avenue. This alignment is being evaluated in a separate study.

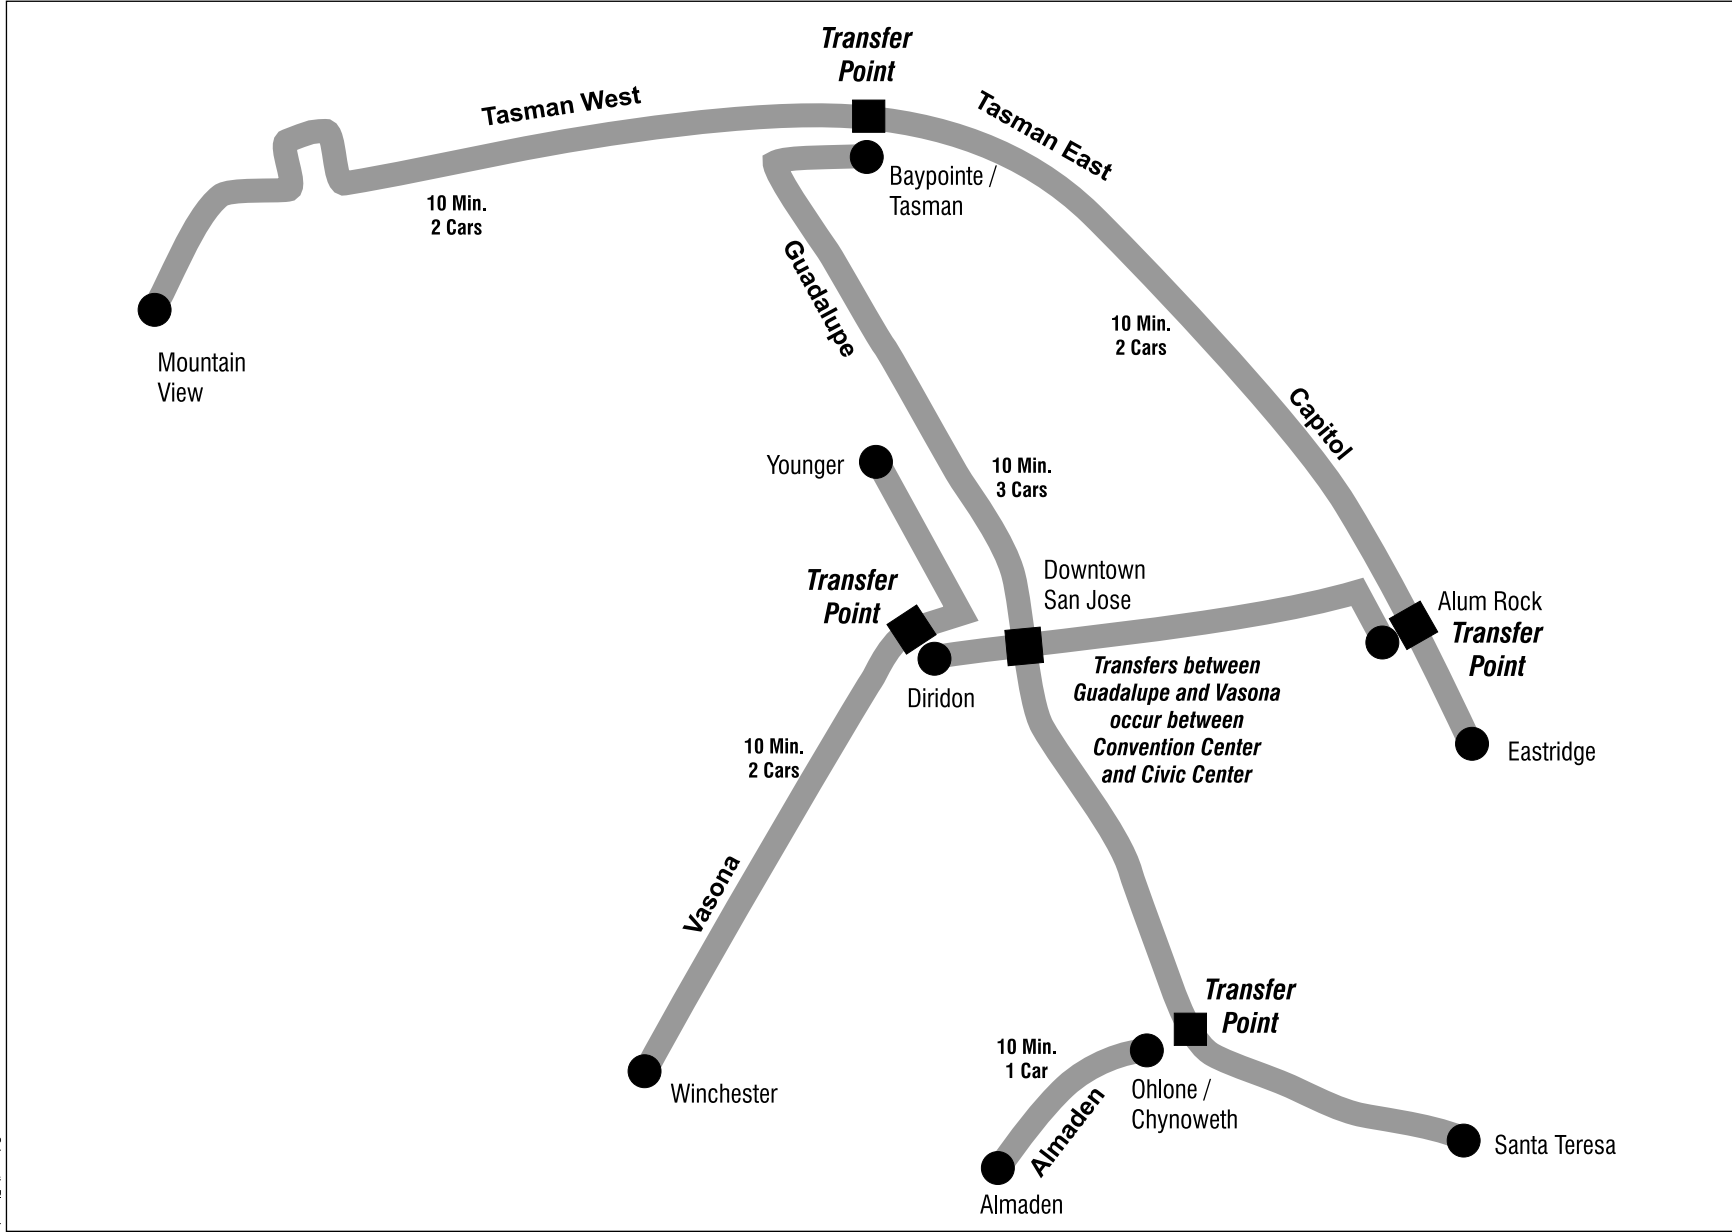

Light rail trains would generally operate in the median of Capitol Expressway with a dual track configuration, although at some locations the alignment transitions to the side of the corridor for a limited distance. Three automobile travel lanes would be provided on each side of the trackway. At intersections, turning lanes would accommodate access to side streets. A combination two-way multi-use path would be provided on one side of the Expressway and a sidewalk on the opposite side from the Alum Rock Station to the Nieman Boulevard intersection. Past Nieman a sidewalk would be provided on both sides, but no separate multi-use path. Between Ocala and Nieman, a separate multi-use path would be provided on both sides of the corridor. In addition, the outside curb lane in both directions will be sufficiently wide enough to allow bicycle use in the roadway.

DOWNTOWN EAST VALLEY CAPITOL EIR

Figure 1-1

PROPOSED STATION LOCATIONS

Schematic Plan only

Korve Engineering, Inc.
Manuel Padron & Associates

DOWNTOWN EAST VALLEY CAPITOL EIR

Figure 1-2

SCHEMATIC LRT OPERATING PLAN

Travel time from the Alum Rock station to the SR 87 station would be approximately 17 minutes. The total travel time for the entire corridor from SR 87 to Mountain View would be about 70 minutes. Expected daily ridership along the Capitol Expressway LRT extension is 9,800 daily riders by 2010 and 11,100 daily riders by 2025.

The light rail extension would be fully accessible in accordance with the Americans with Disabilities Act (ADA).

1.2 Stations & Parking

Up to 10 stations are proposed for the Capitol Expressway Light Rail Corridor, with each station identified by the nearest major cross street on Capitol Expressway. The terminal station at Alum Rock is being constructed as part of the Capitol Avenue Light Rail Project scheduled to open in 2004. Table 1-1 lists the proposed stations and locations. Stations for which optional locations are under consideration or that may be constructed at a future date are noted in Table 1-1. The platform configuration is a combination of center and side opposite. Park-and-ride facilities currently exist at Alum Rock, Eastridge, and Capitol Expressway/SR 87. These facilities would be maintained and enhanced, as necessary, to serve demand. Additional park-and-ride facilities are being considered for the Ocala and Monterey Highway stations. The Monterey Highway park-and-ride would be in conjunction with a relocation of the Capitol Caltrain platform southward near the proposed light rail station.

1.3 Project Scheduling

A detailed funding plan for design and construction has not been developed; therefore a complete construction schedule is not available at this time. The environmental review process is expected to be completed in early 2004. If funding is available, engineering design, which typically takes 24 to 30 months to complete, could commence after environmental review. Construction activities can typically begin approximately two years after completion of environmental review. Under any scenario, revenue service would not begin until 2008, or beyond.

The project will likely be constructed in phases. A likely initial phase would be from Alum Rock to Eastridge. A detailed phasing plan has not been developed.

1.4 Traffic Analysis Alternatives

This report provides an evaluation of traffic and transportation issues related to the proposed extension of the VTA light rail system along Capitol Expressway. This report outlines the impacts of the Proposed Project on the local and regional transportation network. The impacts of the Proposed Project were evaluated using the policy guidelines of the VTA's Congestion Management Program (CMP), and the City of San Jose.

Table 1-1 Proposed Capitol Expressway Light Rail Corridor Stations

| Station | Park-and-Ride | Platform Type | Comments |
|----------------------|---------------|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Story | No | Center (elevated or depressed) | The station platform is elevated at this location. Two elevated designs are being considered; one with median access and one with pedestrian overcrossings. Another option is a tunnel under Story Road with a depressed open-air station. |
| Ocala/ Cunningham | Potential | Side Opposite (at-grade) | Three options have been considered for the location of the station platform. One option configures the station with side opposite platforms at Ocala. Park-and-ride facilities may be available at this station. Another option configures the station with side opposite platforms at Cunningham. The third option has a center platform located between Ocala and Cunningham with grade-separated access into the median from the sides of the Expressway. |
| Eastridge | Yes | Center (at grade or elevated) | The at-grade station platform would be on the west side of the Expressway. An option would be an elevated platform with vertical access to the light rail platforms. Park-and-ride will be available at this station. |
| Nieman | No | Side Opposite (at-grade) | The station configuration would be side opposite platforms at the Nieman Boulevard intersection. An option for the side running alternative would have a side platform along the westside of the Expressway located slightly north of Nieman Boulevard. |
| Silver Creek | No | Center (elevated) | The station platform is elevated at this location with a pedestrian overcrossing. This station may be deferred to a later phase of the project. |
| McLaughlin | No | Side Opposite (at-grade or elevated) | The station configuration depends on the rail alignment. An alignment in the median of Capitol Expressway at the same grade of the expressway would have side opposite platforms. With an elevated alignment over US 101, the platform would also be elevated with access via stairs and elevators. |
| Senter | No | Center (elevated) | A center platform configuration to the east of the Senter intersection is necessary because of the expressway alignment. This would require pedestrian overcrossings with stairs and elevators. |
| Monterey | Yes | Center (at-grade) | Vertical circulation would be provided between the platform in the median of Capitol Expressway and Monterey Highway below. Park-and-ride facilities to serve both the relocated Caltrain Station and the light rail line will be available at this station. |
| Vista Park | No | Side Opposite (at-grade) | Station spacing indicates Vista Park as an appropriate location. |
| SR 87 | Yes | Center (at-grade) | The platform could either be directly beneath SR 87 or just to the west of the SR 87 overcrossing. Existing park-and-ride facilities are available at this station. |

The level of service methodology for the CMP is based on the 1985 Highway Capacity Manual (HCM) methodology. The 1985 HCM methodology uses a weighted average delay for critical approaches at a signalized intersection. The software associated with the level of service methodology is the most recent version of the TRAFFIX software package.

1.4.1 Project Alternatives

As part of VTA's planning process, the following alternatives were considered during Preliminary Environmental Scoping and Conceptual Engineering, but were rejected:

- Light Rail Alternative with Four Mixed Flow and Two HOV Lanes on Capitol Expressway between Capitol Avenue and US 101.
- Light Rail Alternative with Six Mixed Flow and Two HOV Lanes on Capitol Expressway between Capitol Avenue and US 101.

As background to the genesis of these alternatives, it is important to take into account prior decisions made by the City of San Jose and the County of Santa Clara related to Capitol Expressway. In 1991, the San Jose City Council approved the Evergreen Specific Plan project and the Evergreen Development Policy. The Evergreen Specific Plan consisted of the construction of approximately 2,856 dwelling units, commercial uses, and associated infrastructure improvements on an 865-acre site. In addition, there were 1,353 residential units planned for the remainder of the Evergreen Area for which additional traffic capacity improvements would be required in order to comply with the Evergreen Development Policy.

The construction of this development in the Evergreen area was dependent on the implementation of transportation mitigation measures that were the subject of an EIR approved by the San Jose City Council in April 1994. These transportation mitigation measures, which included the construction of HOV (outside) lanes on Capitol Expressway from US-101 to I-680, provided the necessary traffic mitigation to allow development of up to 4,209 dwelling units in the Evergreen area. As it relates specifically to the Capitol Expressway, upon completion of the transportation mitigation measures, the Expressway would consist of three mixed flow and one HOV lane (outside) in both the northbound and southbound directions between US-101 and I-680 until such time as LRT was implemented.

In 1992, the County Board of Supervisors approved the City's request to be the lead agency for the preparation of the EIR for the Capitol Expressway improvements with the understanding that the City was proposing an interim eight-lane facility on Capitol Expressway by adding four additional lanes (two new mixed flow lanes and two new HOV/commuter lanes) between US 101 and I-680. At the time, it was acknowledged that the buildout proposed for Capitol Expressway (six mixed flow lanes plus two HOV lanes) would not allow sufficient room for the future LRT project within the existing right-of-way. However, it was also acknowledged that LRT service with 10-minute headways could provide approximately the same level of passenger throughput as a lane of traffic on Capitol Expressway. Thus, the EIR stated that "given support mechanisms to encourage passenger demand, the LRT could replace one travel lane in each direction while still maintaining adequate traffic levels of service on the expressway." The eight lane facility ultimately approved was to be designed in such a manner to provide for the future elimination of the two inside lanes and the installation of a potential double track light rail system

(with stations) in the median while minimizing the need to reconstruct the remaining six lanes of the Expressway.

In the City's EIR, the construction of the LRT facility was considered as an alternative to the roadway improvements proposed by the Evergreen Specific Plan development. At the time, the LRT alternative was determined to be the environmentally superior alternative. However, it was also determined that private developers did not have the financial ability to substantially fund LRT as mitigation for their approved and pending Evergreen development projects. The City further stated in their EIR that it was not the objective of the proposed Evergreen Specific Plan project to provide transportation capacity that would exceed demand for traffic capacity generated by the project. Therefore, the City approved the project to include the construction of two additional general purpose and two HOV lanes. These mitigation improvements were constructed and have been operating since 1996. The approved Evergreen development is also nearing buildout.

This report analyzes the study intersection operations for the following traffic scenarios. The future year traffic projections were developed using the CMP travel forecasting model.

- Existing – Level of service based on existing traffic counts and existing intersection geometry. Existing conditions are those that occurred in 2000/01.

No Build

- 2010 No Build Alternative – Level of service based on 2010 projections without construction of the light rail project and with existing roadway geometry plus any planned improvements expected to occur prior to 2010. The existing HOV lanes are assumed to remain.
- 2025 No Build Alternative – Level of service based on the 2025 projections without construction of the light rail project and with existing roadway geometry plus any planned improvements expected to occur prior to 2025. The existing HOV lanes are assumed.

Light Rail Alternative

- 2010 Light Rail Alternative – Level of service based on 2010 projections and with the construction of the light rail project. The roadway geometry from the 2010 No Build Alternative is assumed, except as modified because of the Light Rail Alternative and with the removal of the HOV lanes. The Light Rail Alternative assumes a terminus at Eastridge as Phase One and a terminus at SR 87 as a Phase Two.
- 2025 Light Rail Alternative – Level of service based on 2025 projections and with the construction of the light rail project. The roadway geometry from the 2025 No Build Alternative is assumed, except as modified because of the Light Rail Alternative and with removal of the HOV lanes. The Light Rail Alternative assumes a terminus at Eastridge as Phase One and a terminus at SR 87 as Phase Two.

Baseline

- 2010 Baseline Alternative – Level of service based on 2010 projections without the light

rail project, but with transportation system management improvements in the corridor. For the purposes of comparison to the No Build Alternative the HOV lanes are assumed to remain.

- 2025 Baseline Alternative – Level of service based on 2025 projections without the light rail project, but with transportation system management improvements in the corridor. The HOV lanes are assumed to remain.

2.0 EXISTING CONDITIONS

This Section presents a summary of the existing transportation conditions in the study area. A description of the existing roadway network, public transit, bicycle, and pedestrian facilities, along with goods movement, parking, and community access are summarized in this section.

2.1 Roads & Highways

This section summarizes the existing traffic conditions in the study area, including existing roadway facilities, traffic volumes, intersection geometries, and operating conditions at key locations during the weekday AM and PM peak periods.

The study corridor can be regionally accessed by freeways, expressways, and arterials, as well as VTA transit buses, light rail and Caltrain commuter rail. The study area is defined by the alignment of the proposed LRT service. Freeways, local roadways, and intersections included in the study area are discussed below. The study intersections are illustrated in Figure 2-1. A total of 15 signalized intersections are included in the study area, representing nearly all of the signalized intersections along the corridor.

2.1.1 Congestion Management Program (CMP) Network

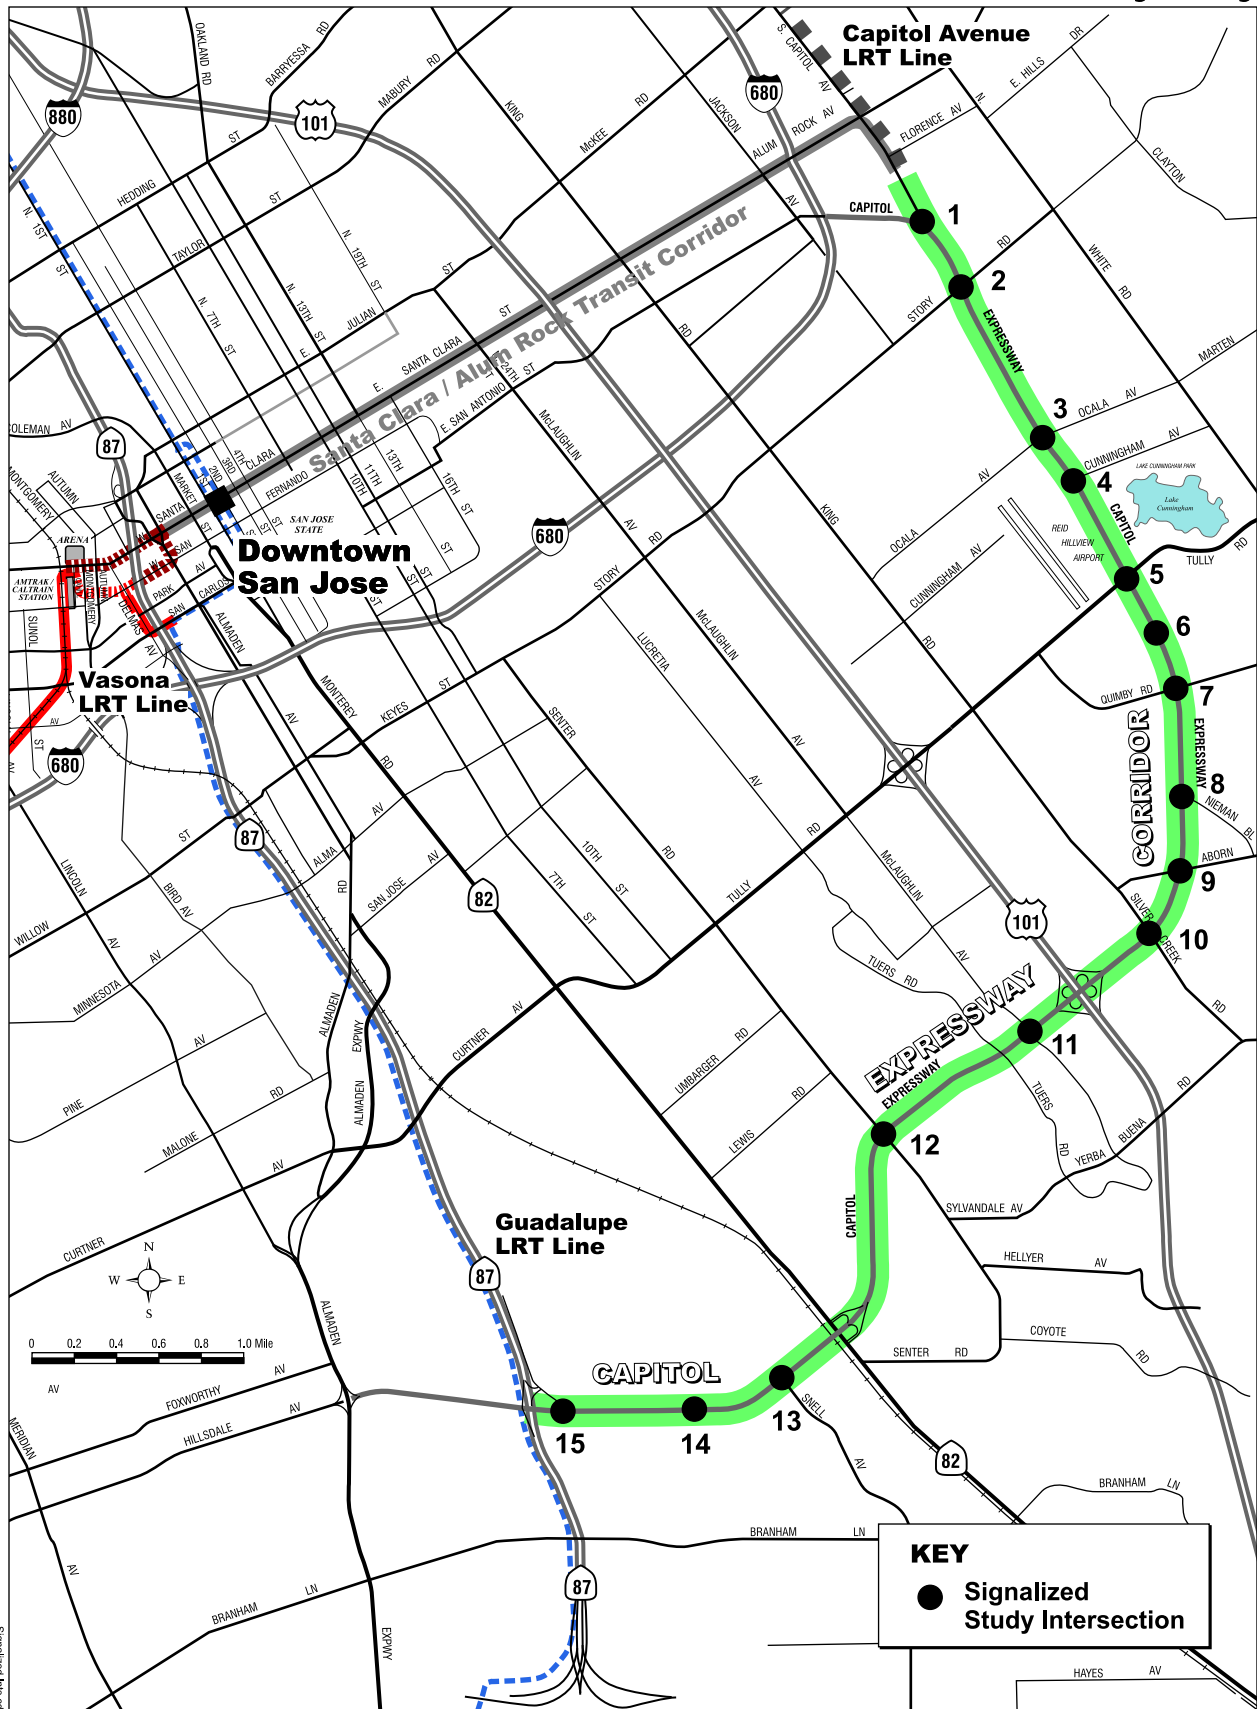

The Congestion Management Program (CMP) legislation requires the development of a County CMP roadway network. The CMP network consists of four types of facilities: freeways, county expressways, urban arterials, and rural highways. The County CMP network is monitored annually to determine conformance with CMP traffic level of service standards.

In the vicinity of the study area, the following roadways are contained within the County CMP roadway network (as defined by the *Congestion Management Program for Santa Clara County*, February 2001). The current operations of each facility as defined by the 2001 monitoring report are also summarized.

2.1.1.1 Freeways

US Highway 101 (US 101) is a 8-lane freeway, two of which are HOV lanes that travel in a north-south direction through the study area. Within the study area, US 101 have one interchange at Capitol Expressway. The interchange is a full cloverleaf design with collector/distributor roadways between the Capitol Expressway ramps and the Yerba Buena ramps to the south. The on-ramps onto US 101 from Capitol Expressway are metered. US 101 is posted for 65 mph through the study area. Daily traffic volumes on US 101 range from 132,000 vehicles per day south of Capitol Expressway to 196,000 vehicles per day north of Capitol Expressway. The peak hour traffic volumes immediately north of Capitol Expressway are 14,200 vehicle per hour in the AM peak and 14,700 in the PM peak.

The 2001 Monitoring and Conformance Report for the Congestion Management Program indicates that during the AM peak hour, US 101 operates at level of service F in the northbound direction and level of service A in the southbound direction for the mixed flow lanes. The HOV

DOWNTOWN EAST VALLEY CAPITOL EIR

Figure 2-1

SIGNALIZED INTERSECTIONS

lanes operate at level of service C in the northbound direction and level of service A in the southbound direction during the AM peak. During the PM peak hour, the northbound general purpose lanes operate at level of service A and the southbound general purpose lanes operate at level of service E. The HOV lanes operate at level of service A in both the northbound direction and southbound direction during the PM peak hour.

Interstate 680 (I-680) is an eight-lane freeway that travels in a north-south direction. The highest traffic volume along this freeway in the proximity of the Proposed Project occurs between McKee Road and Alum Rock Avenue. The Average Annual Daily Traffic (AADT) is 232,000 vehicles. There are ramps entering and exiting the study area at Alum Rock (State Highway 130) and from Capitol Expressway. I-680 is posted for 65 mph through the study area.

The 2001 CMP Monitoring Report notes that I-680 operates at level of service F in both directions during the AM peak hour, with a total traffic volume of 10,980. This volume is well below the capacity of the roadway because traffic has reached a stop-and-go condition. During the PM peak hour, I-680 at Capitol Expressway operates at level of service A in the southbound direction and level of service B in the northbound direction. The total hourly volume is 16,000.

State Route 87 (SR 87) is a 6-lane freeway which travels in a north/south direction at the far west end of the study area. SR 87 extends from US 101 near the Norman Y. Mineta San Jose International Airport (SJIA) to SR 85 south of the study area. The posted speed limited is 65 mph and the Guadalupe light rail corridor operates within the median of SR 87. The on-ramps to SR 87 from Capitol Expressway are metered.

The 2001 CMP Monitoring Report indicates during the AM peak the northbound lanes operate at LOS F and the southbound lanes operate at level of service A. The total AM volume on SR 87 at Capitol Expressway is 5,650 vehicles. During the PM peak, the northbound lanes operate at LOS A and the southbound lanes operate at level of service B. The total volume is 8,140 vehicles. This volume is greater than the AM volume because of the stop-and-go conditions experienced in the AM peak.

2.1.1.2 Other State Highways

Alum Rock Avenue is a four-lane arterial under the jurisdiction of Caltrans and designated as State Route (SR 130). It travels in an east-west direction through the northern part of the study area. Alum Rock is designated as an arterial west of I-680, connects with I-680 with a full freeway interchange and extends westward across US 101 where its name changes to Santa Clara Street. The street then becomes the major east-west arterial to enter the City of San Jose's Central Business District (CBD) from the east. East of I-680 Alum Rock is also designated as SR 130 as it extends further east to Mount Hamilton Road in the foothill area of eastern San Jose. The posted speed limit is 35 mph.

Monterey Highway is a 6-lane divided arterial under the jurisdiction of Caltrans and designated as State Route (SR 82). It travels in a north-south direction and crosses Capitol Expressway west of US 101. An interchange provides access between Capitol Expressway and Monterey Highway. The posted speed limit is 45 mph. The eastbound and westbound on/off-ramps from

Monterey Highway to Capitol Expressway are CMP intersections. The 2001 monitoring report indicates the current operation is level of service B at both ramp terminals.

2.1.1.3 Expressways

Capitol Expressway is a limited access expressway that extends from its interchange with I-680 in the north end of the study area to the south of the Project area with its interchange with SR 87. The Capitol Expressway is a county owned and operated facility. Capitol Expressway is mostly three general purpose lanes in each direction with an HOV lane in the Proposed Project area as the outside fourth lane from US 101 northward to I-680. On-street parking is not permitted along the expressway and no designated bicycle lanes exist in the Proposed Project area. The posted speed limit is 45 mph. Full-movement access is restricted to signalized intersections spaces from $\frac{1}{4}$ mile to over $\frac{3}{4}$ mile.

2.1.1.4 Arterials

The following arterials are owned and operated by the City of San Jose:

Capitol Avenue begins at an intersection with Capitol Expressway near the Proposed Project's northern end and extends north. There are two travel lanes in each direction. The Capitol Avenue Light Rail Project is currently being constructed within the median of Capitol Avenue. Bicycle lanes are designated and signed in both directions for the length of Capitol Avenue. The posted speed limit is 35 mph. The intersection of Capitol Avenue with Capitol Expressway is a CMP intersection. The Congestion Management Agency monitors all CMP intersections on an annual basis for traffic operations during the PM peak hour. The 2001 monitoring report indicates that the intersection of Capitol Avenue with Capitol Expressway operates at level of service E+.

Story Road crosses Capitol Expressway just south of Capitol Avenue. Story Road is a 6-lane divided arterial west of Capitol Expressway with a posted speed of 35 mph. To the east of Capitol Expressway, Story Road is a 4-lane divided arterial, also with a posted speed of 35 mph. Story Road provides local east/west access in southeast San Jose as an extension of Keyes Street near US 101 to its terminus at Fleming Avenue. The Story Road/Capitol Expressway intersection is a CMP intersection. The 2001 monitoring report indicates the current operation is level of service F.

Ocala Avenue crosses Capitol Expressway south of Story Road. Ocala Avenue is a 4-lane, undivided roadway to the east of Capitol Expressway with a posted speed of 35 mph. Ocala Avenue becomes Marten Avenue at White Road. To the west of Capitol Expressway, Ocala Avenue has a single lane in each direction with a two-way left turn lane in the center. At the intersection with Capitol Expressway, Ocala widens to accommodate turning lanes. This portion of Ocala is also posted for 35 mph and extends to King Road. Ocala Avenue at Capitol Expressway is not a CMP intersection.

Cunningham Avenue provides access to Reid-Hillview Airport from Capitol Expressway and extends to White Road to the east along the northern boundaries of Lake Cunningham Park.

This section of Cunningham Avenue is a single lane in each direction with a speed of 35 mph. Cunningham Avenue at Capitol Expressway is not a CMP intersection.

Tully Road is a principal arterial that runs generally east-west through the study area. On both sides of Capitol Expressway, Tully Road has three lanes in each direction separated by a raised median. The posted speed west of Capitol Expressway is 40 mph and the posted speed east of Capitol Expressway is 45 mph. Tully Road extends from the foothills on the east to Monterey Highway on the west where it becomes Curtner Avenue. The Tully Road/Capitol Expressway intersection is a CMP intersection. The 2001 monitoring report indicates the current operation is level of service D.

Quimby Road connects from Mount Hamilton Road (SR 130) in the foothills to Tully Road adjacent to the Eastridge Shopping Center. East of Capitol Expressway, Quimby Road has two travel lanes in each direction. At the intersection with Capitol Expressway, the median is raised. Farther to the east the raised median is replaced by a two-way left turn lane. The posted speed is 40 mph. To the west of Capitol Expressway along the shopping center frontage, Quimby Road has two lanes in each direction, a raised median, and is posted for 35 mph. The Quimby Road/Capitol Expressway intersection is a CMP intersection. The 2001 monitoring report indicates the current operation is level of service E+.

Nieman Boulevard extends from a 'T' intersection at Capitol Expressway southeastward to Yerba Buena where it transitions into Silver Creek Valley Road. At Capitol Expressway, Nieman Boulevard provides one travel lane in each direction and a continuous left turn lane. Left turns from Nieman Boulevard to Capitol Expressway are not permitted. The posted speed limit is 35 mph. Nieman Boulevard/Capitol Expressway is not a CMP intersection.

Aborn Road extends from King Road to the foothills to the east. East of Capitol Expressway, Aborn Road has three lanes in each direction, a raised median and is posted for 40 mph. To the west of Capitol Expressway, Aborn Road has two lanes in each direction, a raised median, and is also posted for 40 mph. The Aborn Road/Capitol Expressway intersection is a CMP intersection. The 2001 monitoring report indicates the current operation is level of service E.

Silver Creek Road extends from Yerba Buena Road to the south of Capitol Expressway and becomes King Road to the north of Capitol Expressway. In the vicinity of the expressway, Silver Creek Road has two lanes in each direction with a raised median. The posted speed is 35 mph. The Silver Creek Road/Capitol Expressway intersection is a CMP intersection. The 2001 monitoring report indicates the current operation is level of service F.

McLaughlin Avenue extends from south of Yerba Buena Road at Coyote Creek Park to where it transitions to 24th Street at San Antonio Street north of I-280. South of Capitol Expressway, McLaughlin Avenue has two lanes in each direction and a raised median. The posted speed is 40 mph. North of Capitol Expressway, McLaughlin Avenue is also two lanes in each direction with a raised median. The posted speed to the north of Capitol Expressway is reduced to 35 mph. The McLaughlin Avenue/Capitol Expressway intersection is a CMP intersection. The 2001 monitoring report indicates the current operation is level of service D.

Senter Road extends from its terminus at Monterey Highway, across Capitol Expressway to its northern terminus at Keyes Street near Spartan Field. South of Capitol Expressway, Senter

Road is two lanes in each direction with a two-way left turn lane to Singleton Road, and then it becomes a single lane in each direction. The posted speed is 35 mph. To the north of Capitol Expressway, Senter Road has two lanes in each direction and is posted for 40 mph. The Senter Road/Capitol Expressway is a CMP intersection. The 2001 monitoring report indicates the current operation is level of service E+.

Snell Avenue extends from south of SR 85 to just north of Capitol Expressway terminating at Hillsdale Avenue. South of Capitol Expressway, Snell Avenue has three travel lanes in each direction with a raised median. The posted speed limit is 40 mph. North of Capitol Expressway, Snell Avenue has two lanes in each direction with a raised median. The posted speed limit is also 40 mph. The Snell Avenue/Capitol Expressway intersection is a CMP intersection. The 2001 monitoring report indicates the current operation is D.

Vista Park Drive extends from just south of Branham Lane to Hillsdale Avenue immediately north of Capitol Expressway. South of Capitol Expressway, Vista Park Drive has one lane in each direction with a two-way left turn lane in the median. The posted speed limit is 35 mph. North of Capitol Expressway, Vista Park Drive is a four-lane divided facility also with a posted speed limit of 35 mph. Vista Park Drive/Capitol Expressway is not a CMP intersection.

Narvaez Avenue extends from south of Branham Lane to north of Hillsdale Avenue. Narvaez Avenue serves as a frontage road to SR 87 with a single lane in each direction and posted for 35 mph. North of Capitol Expressway, Narvaez Avenue provides access to the northbound on-ramp to SR 87. The Narvaez Avenue/Capitol Expressway intersection is a CMP intersection.

The 2001 monitoring report indicates the current operation is level of service D+.

As part of the data collection for the project, photographs were taken of each leg of the study area intersections. Photographs of each approach leg of the study intersections are shown in Appendix A.

Table 2-1 shows the signalized intersections, the designation of each cross street according to the City's General Plan, the spacing of intersections in feet, and the average annual daily traffic volume (AADT). The spacing of the intersections along the expressway varies from 1400 feet to over 4000 feet.

An arterial street accommodates major movements of traffic not served by expressways or freeways. The arterial street is designated mainly for the movement of through traffic, but also performs a secondary function of providing access to abutting properties.

A major collector street serves internal traffic movements within an area and connects the area with the major arterial system. It does not cater for long through trips but does provide access to abutting properties.

A local street has the primary function of providing access to immediately adjacent land.

Table 2-1 Signalized Intersection Cross Street Designation, Distances and AADTs

| | Cross Street | Cross Street Designation ^{1,2} | Distance to Next Intersection ³ (southbound/westbound) (feet) | AADT (west/east or north/south) (vehicles/day) |
|----|---------------------|-----------------------------------------|--------------------------------------------------------------------------------|------------------------------------------------------|
| 1 | Capitol Ave | Arterial | 1,800 | 3,100 / 24,200 |
| 2 | Story | Arterial | 4,200 | 24,000 / 32,000 |
| 3 | Ocala | Arterial | 1,200 | 16,500 / 20,000 |
| 4 | Cunningham | Local | 2,700 | 4,000 / 2,300 |
| 5 | Tully | Arterial | 1,200 | 38,400 / 28,000 |
| 6 | Eastridge | Local | 1,600 | 9,100 |
| 7 | Quimby | Arterial | 2,800 | 30,200 / 30,100 |
| 8 | Nieman | Major Collector | 1,700 | 15,200 / 47,300 |
| 9 | Aborn | Arterial | 2,100 | N/A / 47,300 |
| 10 | Silver Creek (King) | Arterial | 3,700 | 27,200 / 27,000 |
| 11 | McLaughlin | Arterial | 4,400 | 16,500 / 16,500 |
| 12 | Senter | Arterial | 3,500 | 29,000 / 29,000 |
| | Seven Trees | Local | 3,600 | N/A |
| 13 | Snell | Arterial / local north of Capitol Expwy | 2,500 | 17,500 / 29,000 |
| 14 | Vista Park | Arterial | 1,400 | 4,000 / 6,800 |
| | Copperfield | Local | 1700 | N/A |
| 15 | Narvaez | Local | N/A | 15,700 / 6,300 |

Source: City of San Jose, 2002

For this study, the Capitol Expressway corridor is considered to run north/south from Capitol Avenue to Silver Creek Road (King Road) and east/west from McLaughlin Avenue to Narvaez Avenue.

¹ Designations derived from the City of San Jose 2020 General Plan.

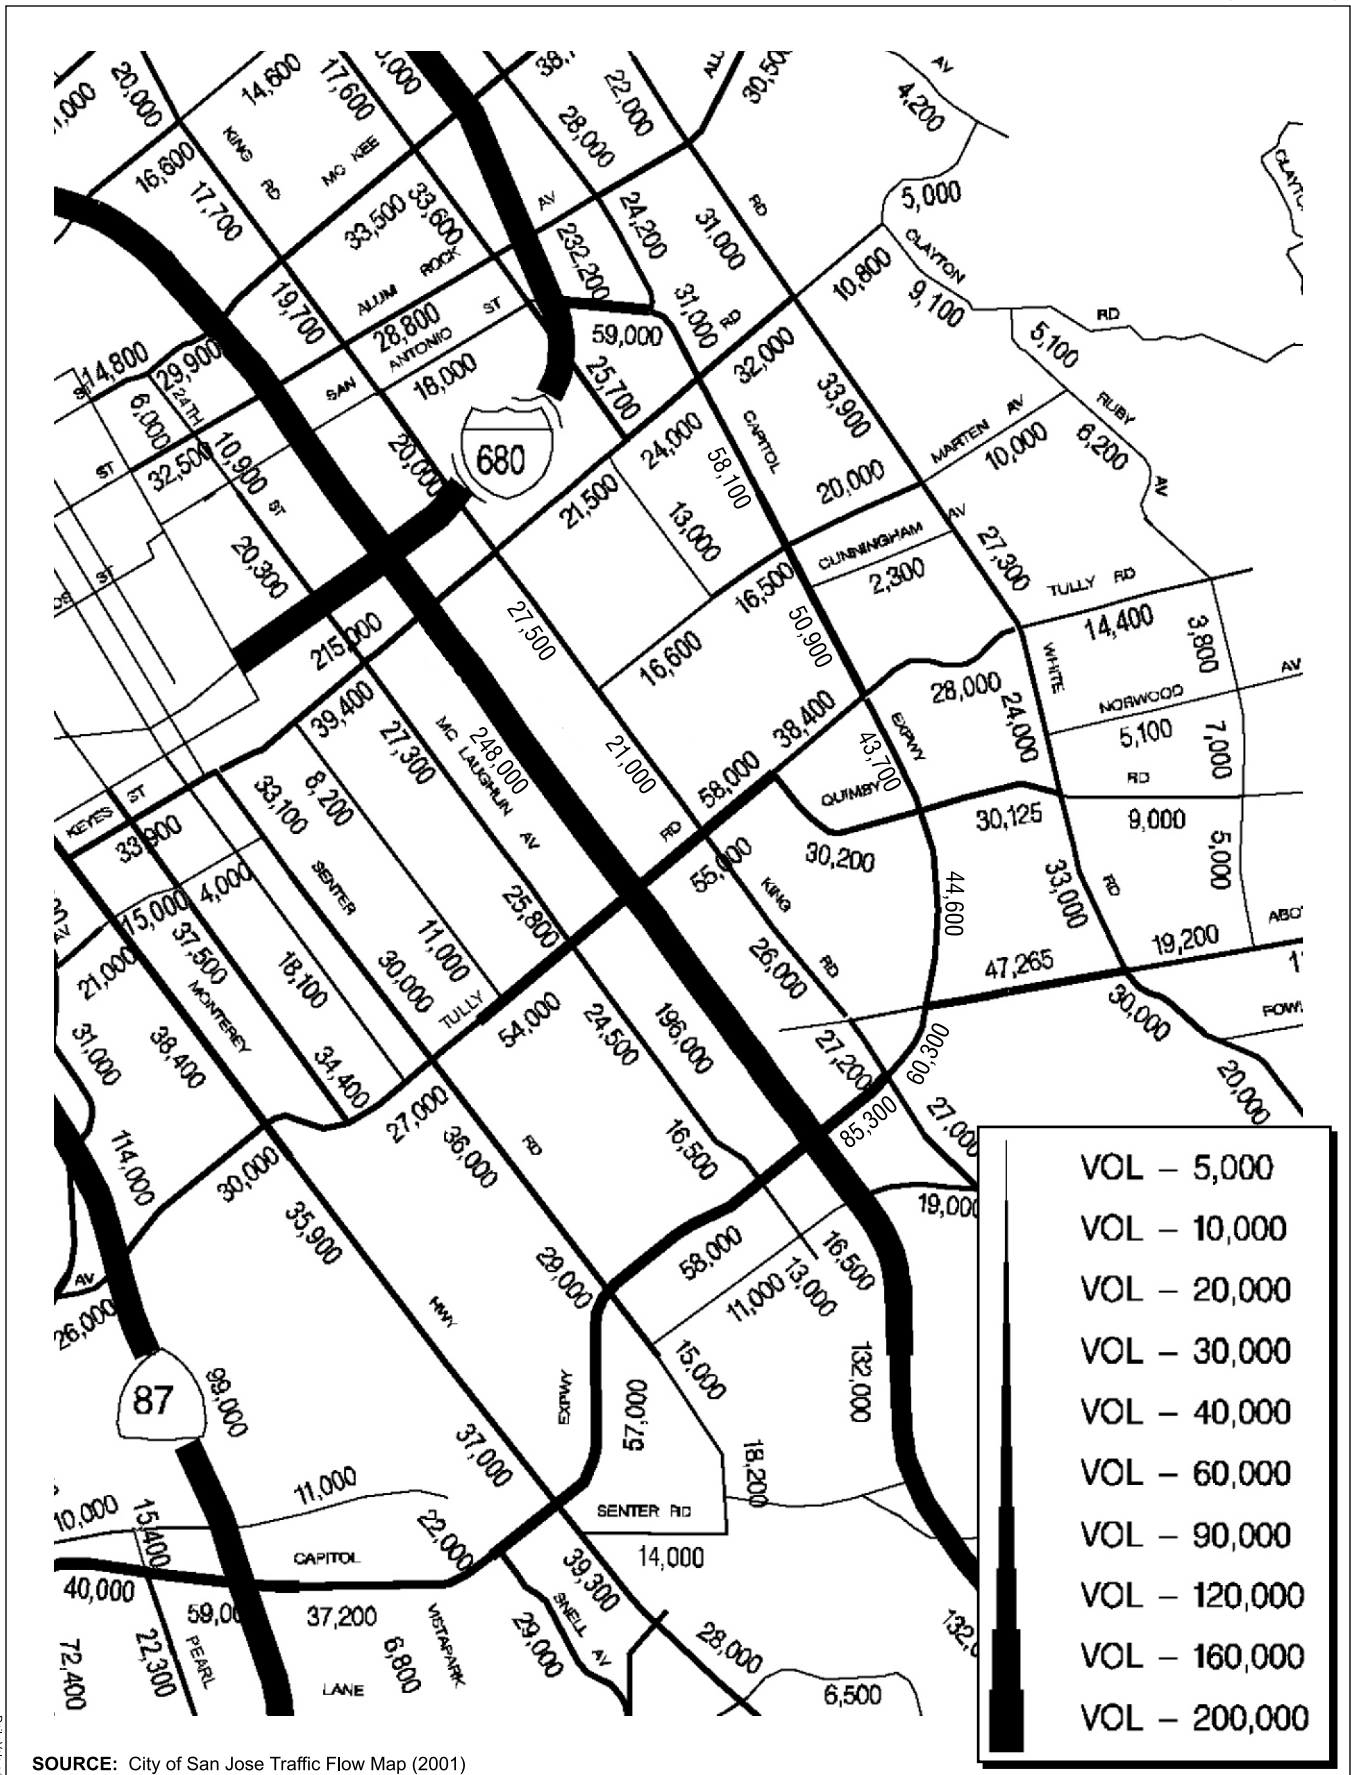

² Where cross street designations differ, the separate West/East or North/South designations are shown.

³ Distances are rounded to the nearest 100 feet.

2.2 Traffic Operations

2.2.1 Existing Traffic Volumes

Figure 2-2 shows the annual average daily traffic volumes on major streets within the study area. Within the study area, Capitol Expressway is noted as carrying 58,000 vehicles per day just west of US 101.

SOURCE: City of San Jose Traffic Flow Map (2001)

July 2002

DOWNTOWN EAST VALLEY CAPITOL EIR

**Figure 2-2
DAILY TRAFFIC VOLUMES**

The analysis of existing traffic conditions focused on 15 intersections along Capitol Expressway. Peak hour traffic operations are a more accurate gauge of traffic congestion than daily traffic. Intersections were analyzed during the AM and PM peak hour to determine existing traffic operations. Traffic volumes were obtained from the City of San Jose or were collected specifically for this analysis.

Table 2-2 notes the intersections included in the study area, the source of the traffic counts, and the date of the counts. Appendix B details the existing traffic signal operating parameters such as cycle time, loss time, minimum green times, signal control and right turn treatments for all study intersections for both the AM and PM peak hours. Appendix C shows the existing background data (traffic volumes and lane configurations) presented graphically.

Table 2-2 Traffic Count Sources & Dates

| Cross Street | | AM | | PM | |

2.2.2 Level of Service Analysis

Consistent with the City of San Jose database, the intersections were analyzed based on the *CMP Traffic Level of Service Analysis Guidelines* (October 1997). The guidelines stipulate that analysts evaluate intersection levels of service using the TRAFFIX software program (version 7.5R1), which is based on the Highway Capacity Manual methodology and provides results similar to results from the Highway Capacity Manual & Software. TRAFFIX estimates the operations of intersections and assigns a letter-grade level of service to the intersections based on the average stopped delay per vehicle.

For signalized intersections in an urban environment, an intersection that has an operational level of service of level of service D or better is generally considered to perform satisfactorily. A

level of service E designation suggests that the intersection is unstable, teetering between successful operations and breakdown, with critical volumes approaching saturation. An intersection with a level of service F designation is considered to have failing operations and excessive delay due to overcapacity. Table 2-3 shows the average stopped delay thresholds associated with each level of service interval.

Table 2-3 CMP Level of Service Thresholds

| LOS | Average Stopped Delay (seconds / vehicle) |
|-----|----------------------------------------------|
| A | 0 to 5.0 |
| B+ | 5.1 to 7.0 |
| B | 7.1 to 13.0 |
| B- | 13.1 to 15.0 |
| C+ | 15.1 to 17.0 |
| C | 17.1 to 23.0 |
| C- | 23.1 to 25.0 |
| D+ | 25.1 to 28.0 |
| D | 28.1 to 37.0 |
| D- | 37.1 to 40.0 |
| E+ | 40.1 to 44.0 |
| E | 44.1 to 56.0 |
| E- | 56.1 to 60.0 |
| F | Greater than 60.0 |

Source: Santa Clara Valley Transportation Authority Congestion Management Program, Transportation Impact Analysis Guidelines, May 1998.

2.2.3 Existing Levels of Service

Table 2-4 shows the calculated average stop delay and the resultant level of service classifications for each of the study intersections. A discussion of the findings of existing traffic operations for the corridor is presented below. Figure 2-3 shows the levels of service at each study intersection along the corridor. Appendix G includes detailed TRAFFIX printouts for each study intersection, and for convenience is combined with TRAFFIX printouts for future horizon years which will be discussed later in this report.

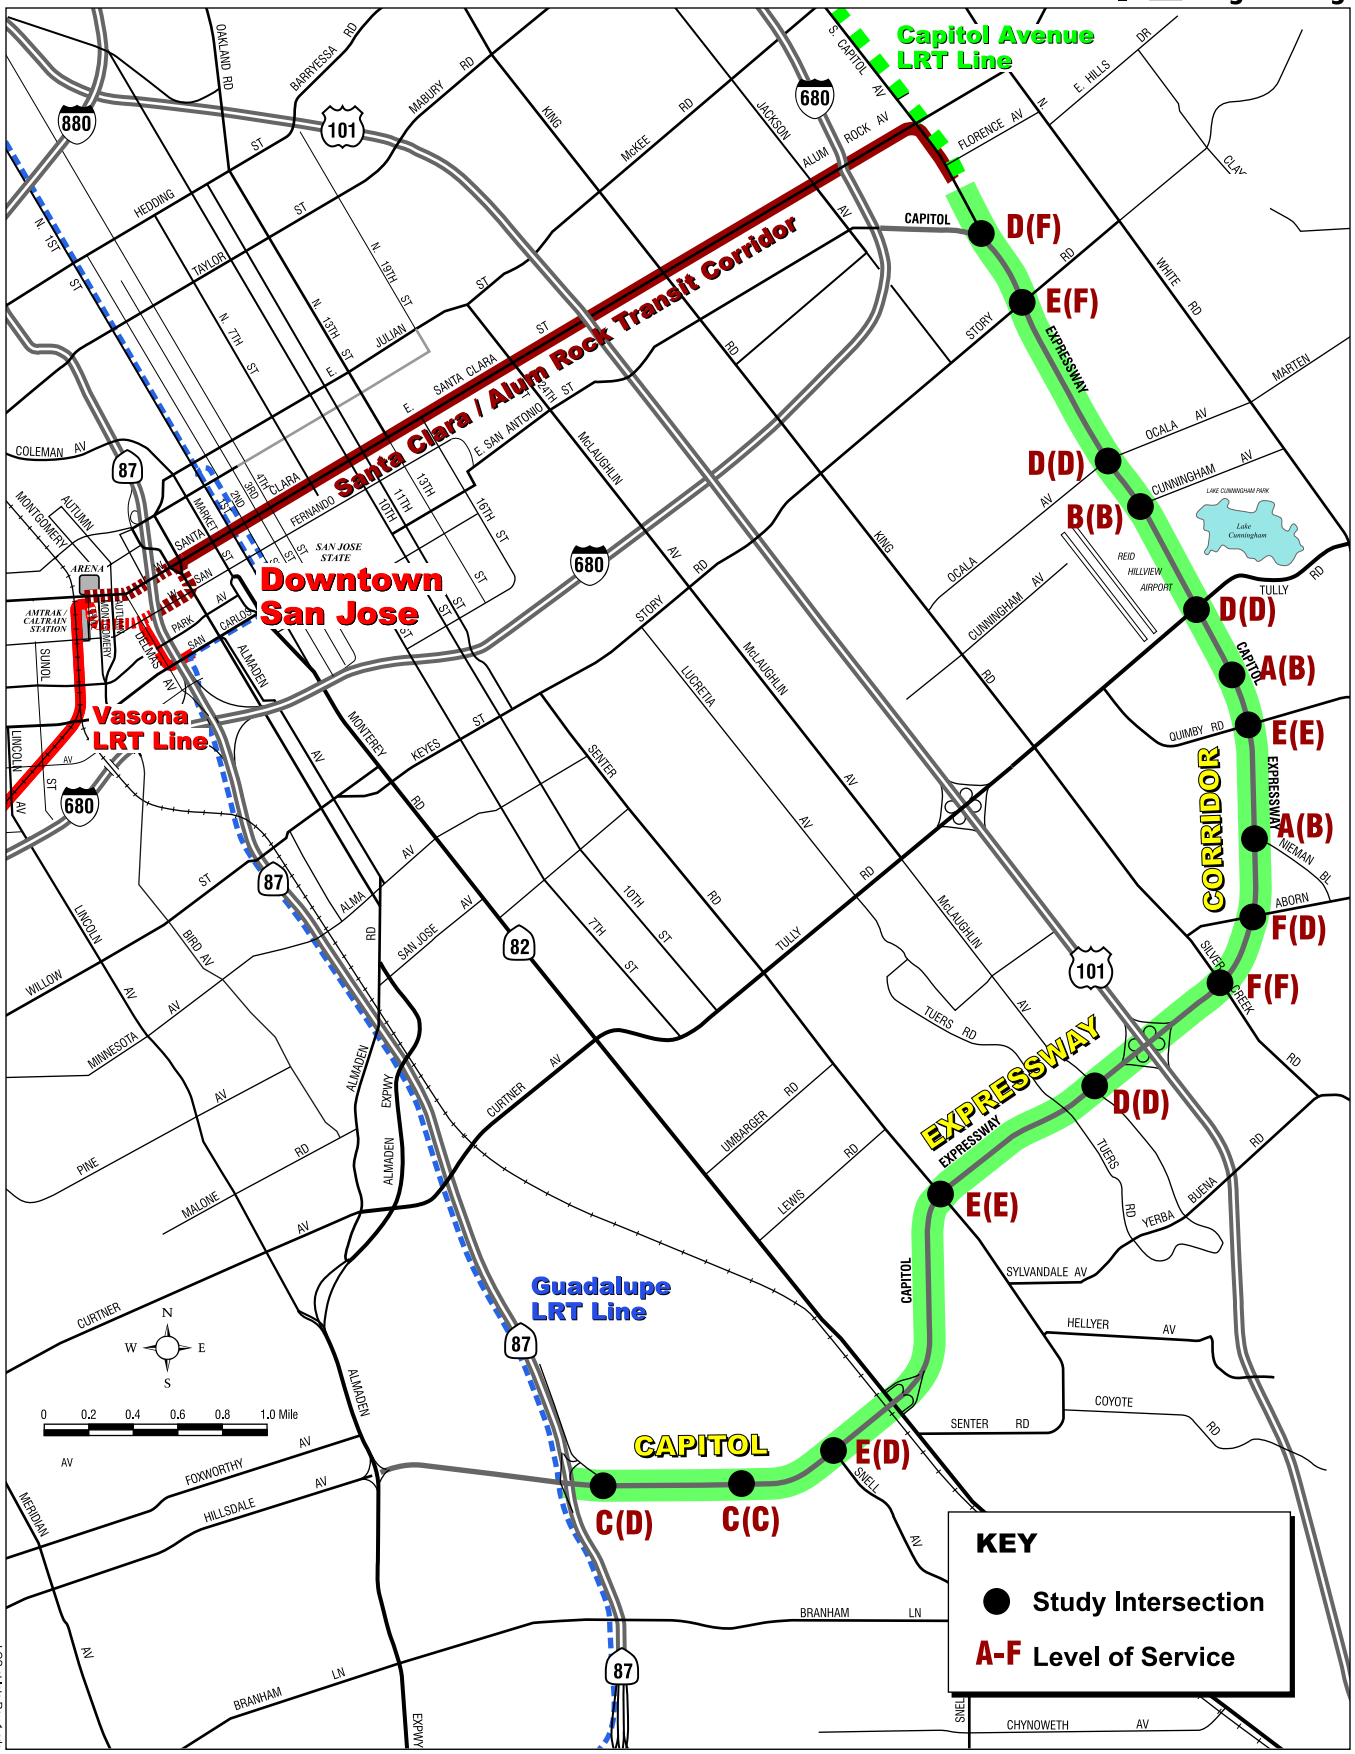

The intersections along Capitol Expressway vary between acceptable operations to intersections having unstable (level of service E) and failing (level of service F) levels of service. Generally, volumes are quite heavy along the main axis of Capitol Expressway and often along the cross-streets as well, resulting in diminished operational performance. Levels of service at Cunningham, Eastridge Loop and Nieman, are good because the cross street volumes are lower.

Table 2-4 Existing Intersection Levels of Service

| Existing Conditions | CMP? | AM | | | PM | | |
|---------------------|------|------------------|----------|------|------------------|----------|------|
| | | Level of Service | Delay(s) | V/C | Level of Service | Delay(s) | V/C |
| 1 Capitol | Yes | D+ | 26.1 | 0.62 | F | 69.7 | 0.93 |
| 2 Story | Yes | E | 50.3 | 0.95 | F | 79.2 | 1.05 |
| 3 Ocala | No | D | 35.1 | 0.77 | D | 33.2 | 0.85 |
| 4 Cunningham | No | B+ | 6.6 | 0.60 | B+ | 6.5 | 0.60 |
| 5 Tully | Yes | D | 36.4 | 0.85 | D- | 39.9 | 0.76 |
| 6 Eastridge | No | A | 4.1 | 0.49 | B | 8.3 | 0.49 |
| 7 Quimby | Yes | E | 53.4 | 0.85 | E | 44.5 | 0.76 |
| 8 Nieman | No | A | 3.0 | 0.36 | B | 7.9 | 0.43 |
| 9 Aborn | Yes | F | 70.1 | 1.03 | D | 31.1 | 0.66 |
| 10 Silver Creek | Yes | F | 62.7 | 1.05 | F | 102.8 | 1.21 |
| 11 McLaughlin | Yes | D- | 37.2 | 0.77 | D | 35.0 | 0.70 |
| 12 Senter | Yes | E | 48.2 | 0.93 | E | 45.0 | 0.74 |
| 13 Snell | Yes | E | 48.8 | 0.99 | D | 29.0 | 0.37 |
| 14 Vista Park | No | C | 22.6 | 0.62 | C | 22.5 | 0.73 |
| 15 Narvaez | Yes | C | 22.5 | 0.54 | D | 32.0 | 0.53 |

In the AM peak hour, the intersections at Story Road, Quimby Road, Senter Avenue and Snell Avenue have unstable operations (level of service E), while intersection operations fail (level of service F) at Aborn Road and Silver Creek Road. At Story Road the heavy southbound left turn volume (670 vph) combined with the heavy northbound through and left turn volumes (2650 vph and 440 vph, respectively) on Capitol Expressway cause the intersection to operate at level of service E in the AM peak. For Quimby Road, approach volumes are high in each direction but the volumes on westbound Quimby Road are very high, especially the left turn (820 vph) and right turn (780 vph) movements. At Snell Avenue and Senter Road, heavy volumes on each approach and heavy left turn volumes saturate the intersection. The high right turn volume for northbound Snell Avenue (750 vph) is also a contributing factor.

For Aborn Road, an extremely heavy left turn volume (1240 vph) from westbound Aborn Road, along with generally heavy volume on other movements (notably, 2080 vph for through movements on northbound Capitol Expressway), causes the operational performance of this intersection to be F in the AM peak. The intersection of Silver Creek Road has very high through volumes on Capitol Expressway (2310 vph northbound; 2230 vph southbound) and very high left turn volumes for northbound Capitol Expressway (750 vph) and westbound Silver Creek Road (860 vph).

April 2003
Rev 6/13/03

DOWNTOWN EAST VALLEY CAPITOL EIR
Figure 2-3
2000 LEVELS OF SERVICE
AM (PM) Peak Hour

In the PM peak hour, Quimby Road and Senter Road have unstable operations (level of service E), while intersection operations fail (level of service F) at Capitol Avenue, Story Road and Silver Creek Road. At Quimby Road and Senter Road, heavy volumes on each approach and heavy left turn volumes saturate the intersection.

At Capitol Avenue, the very heavy southbound through volume (2880 vph) and heavy southbound left turn volume (510 vph) on Capitol Expressway compete with the very heavy westbound left turn volume (970 vph) on Capitol Avenue for green time in the cycle. Meanwhile, for Story Road it is the very heavy southbound through and left turn volumes (2700 vph and 960 vph, respectively) on Capitol Expressway that dominate the intersection. The extremely heavy northbound through volume on Capitol Expressway at Silver Creek Road and the heavy left turn volumes for northbound, southbound, and westbound movements (510 vph, 420 vph, and 720 vph, respectively) combine to cause failing intersection performance at this intersection. Table 2-5 presents the intersections along Capitol Expressway that currently operate at unstable or failing levels of service. It also summarizes which intersection movements likely contribute most to the poor operations.

Table 2-5 Existing Unstable & Failing Intersections

| Cross Street | Period | | Comments |
|-------------------|----------|----------|-----------------------------------------------------------------------------------------------------------------------|
| | AM | PM | |
| Capitol Avenue | | Fails | Very heavy SB through & WB left turn volumes. Heavy SB left turn volume. |
| Story Road | Unstable | Fails | Heavy SB left turn & NB through volumes in AM. Very heavy SB left turn & through volumes in PM. |
| Quimby Road | Unstable | Unstable | Very heavy WB left turn volume in AM. Heavy left turn volumes in each period. Heavy NB & SB through volumes. |
| Aborn Road | Fails | | Extremely heavy WB left turn volume. Heavy volume on remaining critical movements. |
| Silver Creek Road | Fails | Fails | Very heavy NB & SB through volumes. Very heavy WB & NB left turn volumes. Heavy volumes on remaining movements. |
| Senter Road | Unstable | Unstable | Heavy volumes on most movements. |
| Snell Avenue | Unstable | | Heavy volumes on most movements. Heavy NB right turn volume. |

2.2.4 Queuing Analysis

The existing left turn queuing analysis was conducted at the major intersections along Capitol Expressway. Table 2-6 displays the summary of the existing left turn queuing conditions at the 15 study area intersections. The existing AM and PM peak hour left turn queues were calculated based on the existing left turn traffic volumes and the existing signal timing plans. The data in Table 2-6 indicate left turn storage bays that have the potential to overflow. An indication of over capacity does not necessarily imply that the lane will overflow since signal synchronization and progressions will tend to minimize queues.

Table 2-6 Arterial Queuing Summary – Existing Conditions

| | | NBL | | SBL | | EBL | | WBL | | Cycle | Queue/Lane (FT) | | | | Ext. Storage (FT) | | | | Over Capacity? (Y=Yes, N=No) | | | |

¹Both EB & WB are shared left through lanes with approach phasing
²SB left is exclusive and shared left through lane with approach phasing
³EB left contains two 250 ft lanes and 400 ft of single lane for storage, average of 325 ft per lane has been used
⁴Both NB & SB are shared left through lanes with approach phasing
 Required storage per vehicle 25 feet.

2.2.5 Travel Times

Travel time surveys along the corridor were conducted during the AM and PM peak hours in December 2001 and April 2002. Three travel time runs in each direction were completed during the AM peak and six during the PM peak. The travel time runs were separated by direction and the times averaged.

Table 2-7 summarizes the travel times between several intersections along the corridor by direction for the peak hours. The travel times are also shown graphically on Figure 2-4 through Figure 2-7. Figure 2-4 shows the northbound AM travel time and Figure 2-5 shows the northbound PM travel time. Figures 2-6 and 2-7 show the southbound travel times for the AM and PM peak hours. For the segment between Alum Rock and Tully, the northbound speed is slower in the AM peak than the PM peak. In the southbound direction the travel speeds are comparable during both peak hours. Between Tully and McLaughlin the northbound travel speed is slightly faster in the AM than the PM. The southbound travel speed is considerably slower in the AM peak than the PM peak. Finally, the segment between McLaughlin and SR 87 has similar northbound and southbound travel times in the AM and PM peaks. In the southbound direction the AM travel is 10 mph slower than the PM. Overall, the average travel speed along the corridor in both directions in both peak hours is in the low to mid 20's mph.

Table 2-7 Travel Times

| Intersection | Distance (miles) | Traveling Northbound | | | | Traveling Southbound | | | |
|----------------------------|------------------|----------------------|-------------|-------------------|-------------|----------------------|-------------|-------------------|-------------|
| | | AM | | PM | | AM | | PM | |
| | | Travel time (min) | Speed (mph) | Travel time (min) | Speed (mph) | Travel time (min) | Speed (mph) | Travel time (min) | Speed (mph) |
| Between Alum Rock & Tully | 2.7 | 7.4 | 21.9 | 5.3 | 30.7 | 6.9 | 23.5 | 7.0 | 23.1 |
| Between Tully & McLaughlin | 3.0 | 5.3 | 34.1 | 6.3 | 28.6 | 8.7 | 20.7 | 5.0 | 36.1 |
| Between McLaughlin & SR 87 | 2.6 | 8.1 | 19.2 | 9.6 | 16.3 | 8.1 | 19.2 | 5.8 | 26.8 |

2.3 Transit Network

The transit network in the East Valley study area includes a variety of modes. The Santa Clara Valley Transportation Authority (VTA) operates regular, limited stop, and express bus lines as well as light rail service. It also participates in the operation of the Caltrain commuter rail service that links the South Bay, the Peninsula, and San Francisco.

2.3.1 VTA Public Transit

The VTA operates public transit services in Santa Clara County. These services include light rail transit on three lines and bus service on 77 routes. Existing transit operating characteristics are from a point in September 2001. The VTA would also operate the proposed Capitol Expressway light rail line.

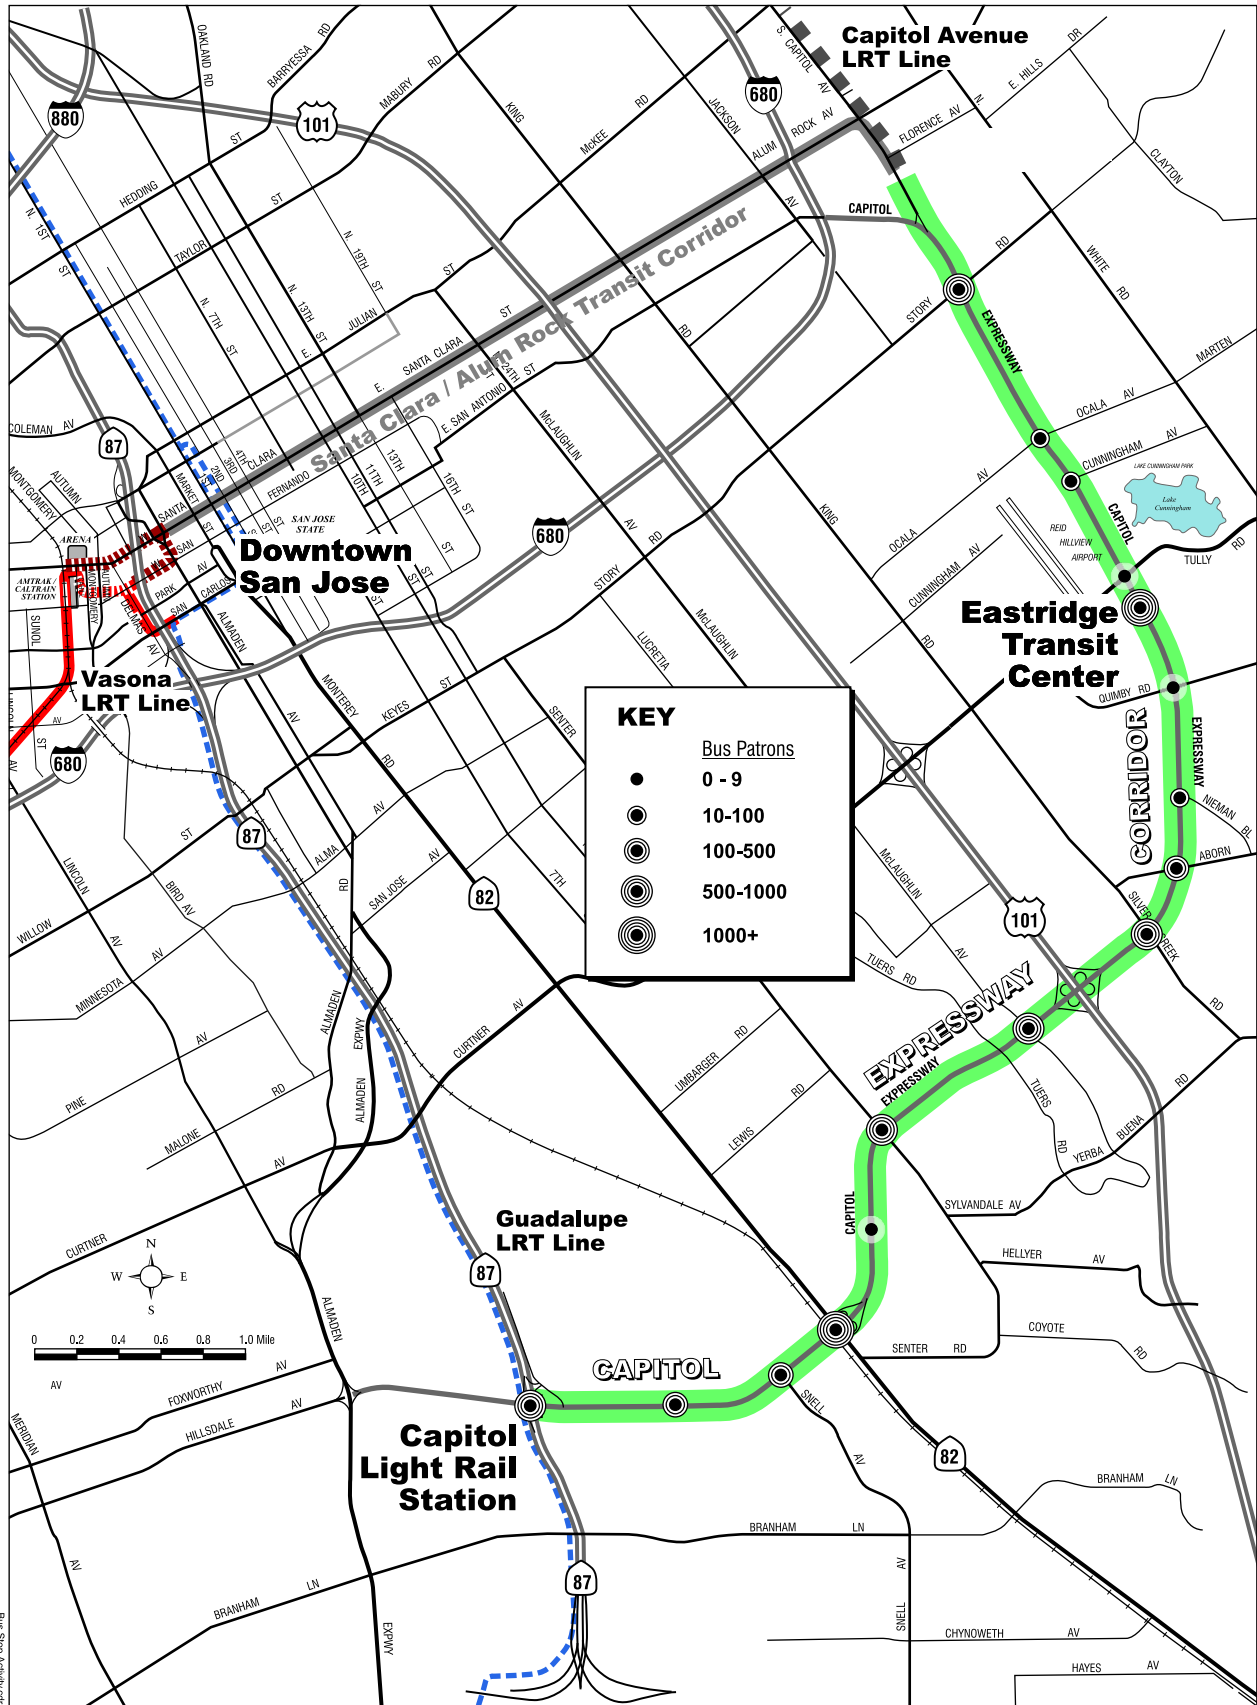

Existing transit service in the East Valley is dominated by long-haul bus service. The VTA operates several bus routes on major cross-town streets, connecting the area to the rest of the region. As well, it operates some local services in the Evergreen neighborhoods. Connections within the system are focused on the Eastridge Transit Center, which currently serves 14 bus routes, and at the intersection of Monterey Highway and Senter Road, where nine routes meet. The existing transit network is presented in Figure 2-8.

The majority of regular bus routes run weekdays from early in the morning (5:00 am to 6:00 am) until late in the evening (10:00 pm to midnight) and weekends from early in the morning until mid-evening (8:00 pm to 10:00 pm). Noteworthy exceptions to this rule include Line 68, which offers weekday service between downtown San Jose and Gilroy over extended hours, and Lines 37, 38, and 67, which all terminate service in the early evening (5:00 pm to 7:00 pm). Limited stop and express bus services operate only during the peak periods from Monday to Friday. Table 2-8 lists the bus lines that serve the East Valley study area along with their hours of operation and general headways.

The study area is served by several of the most heavily-used bus routes in the VTA system. Lines 22 (King Road to Santa Clara Street), 25 (Story Road), 66 (Monterey Highway), 68 (Monterey Highway), and 70 (Capitol Expressway and Jackson Avenue) each carry more than 7,000 passengers on an average weekday over the full length of their routes (not just the portions lying within the study area). Table 2-9 presents the average weekday ridership for the bus lines that serve the East Valley study area.

Major intersections and transit centers are the principal locations where passengers may make connections between routes. It is at these locations that passenger activity (i.e., boardings and alightings) is focused. Eastridge Transit Center and the intersection of Monterey Highway and Senter Road have the highest levels of passenger activity in the study area with 7,930 and 3,790 boardings and alightings, respectively. Other locations with heavy activity include the Capitol Light Rail Station on the Guadalupe Light Rail Line and the intersections of Capitol Expressway and Story Road, Silver Creek Road, McLaughlin Road, and Senter Road. Table 2-10 summarizes the daily passenger activity for the major intersections and transit centers. The total passenger activity for these locations is presented graphically in Figure 2-9.

Transit passengers in the East Valley have access to the VTA light rail network through the Guadalupe light rail line. Direct service is available at the Capitol Light Rail Station at the interchange of the Capitol Expressway and SR 87 (Guadalupe Parkway). East Valley passengers may also transfer from buses to the Guadalupe light rail line at Tamien Station (Line 25) and Curtner Station (Line 26). The Guadalupe light rail line operates 24 hours a day with daytime service available every 10 minutes. The hours of operation and headways are presented in Table 2-11 for the Guadalupe, Tasman, and Almaden light rail lines.

For both the bus and light rail operations in the system, the VTA offers an integrated fare structure. Riders pay the same fare to ride regular and limited stop buses as they do to ride light rail. The fare structure is based off of an adult single ride fare of \$1.40 and a day pass fare of \$4.00. Discounted fares are available to youth and senior riders, as well as to frequent system users through monthly and annual passes. Higher fares are charged for express bus lines to account for the higher level of service they provide; however, discount fares are also available for these lines. Table 2-12 lists the current fares charged by the VTA to passengers using the transit network. VTA is currently considering modifications to the fare structure.

Table 2-12 VTA Transit Fares

| Fare Type | Adult | Youth (5-17) | Senior (65+)/Disabled |
|-----------------------------|----------|--------------|-----------------------|
| Single Ride | \$1.40 | \$0.85 | \$0.45 |
| Express Single Ride | \$2.25 | \$0.85 | \$0.45 |
| Day Pass | \$4.00 | \$2.50 | \$1.25 |
| Express Day Pass | \$6.00 | * | * |
| Day Pass Tokens (Pack of 5) | \$18.00 | \$11.25 | -- |
| Monthly Flash Pass | \$45.00 | \$27.50 | \$11.00 |
| Express Monthly Flash Pass | \$72.00 | * | * |
| Annual Flash Pass | \$495.00 | \$297.00 | \$121.00 |
| Express Annual Flash Pass | \$792.00 | * | * |

*Youth and Senior/Disabled Day Passes and Monthly Stickers are valid on all VTA Bus and Light Rail Services.

2.3.2 Caltrain Service

The Peninsula Corridor Joint Powers Board includes representatives from San Francisco, San Mateo, and Santa Clara Counties. It operates Caltrain commuter rail service along a 77-mile right-of-way between Gilroy and San Francisco. Service in the East Valley study area is operated by the VTA with the cooperation of the Union Pacific Railroad (UPRR), which owns the right-of-way between Gilroy and Tamien Station.

In the East Valley study area, Caltrain runs along the west side of Monterey Highway where it passes under Capitol Expressway. The Caltrain station nearest the Capitol Expressway Light Rail Project is the Capitol Station, which is located approximately 2,000 feet north at the intersection of Fehren Avenue and Monterey Highway. Commuter rail service at this station is offered by four northbound trains in the morning and four southbound trains in the afternoon (Table 2-13). (The VTA is currently negotiating with the UPRR to increase the number of trains and to install service in the off-peak direction.) Travel from Capitol Station takes approximately 15 minutes to Downtown San Jose and 1 hour and 50 minutes to San Francisco.

Table 2-13 Weekday Caltrain Service at Capitol Station

2.4 Park & Ride Facilities

Three existing park-and-ride facilities lie adjacent to the proposed light rail line. The only facility that currently serves light rail is located at the Capitol Station on the Guadalupe light rail line, where two lots provide over 900 parking stalls for transit users. Bus passengers at the Eastridge Transit Center are served by a facility with approximately 130 stalls, while a new park-and-ride lot with 105 stalls has been constructed at the Alum Rock Station to serve the under-construction Capitol Avenue light rail line which is scheduled to open in 2004.

A nearby park-and-ride lot currently serving the Caltrain Station is located at the intersection of Monterey Highway and Fehren Avenue. It currently serves the Caltrain Capitol Station, which lies approximately 2,000 feet north of Capitol Expressway. It has an approximate capacity of 370 stalls. Table 2-14 summarizes the details of the four facilities, while Figure 2-10 locates them graphically.

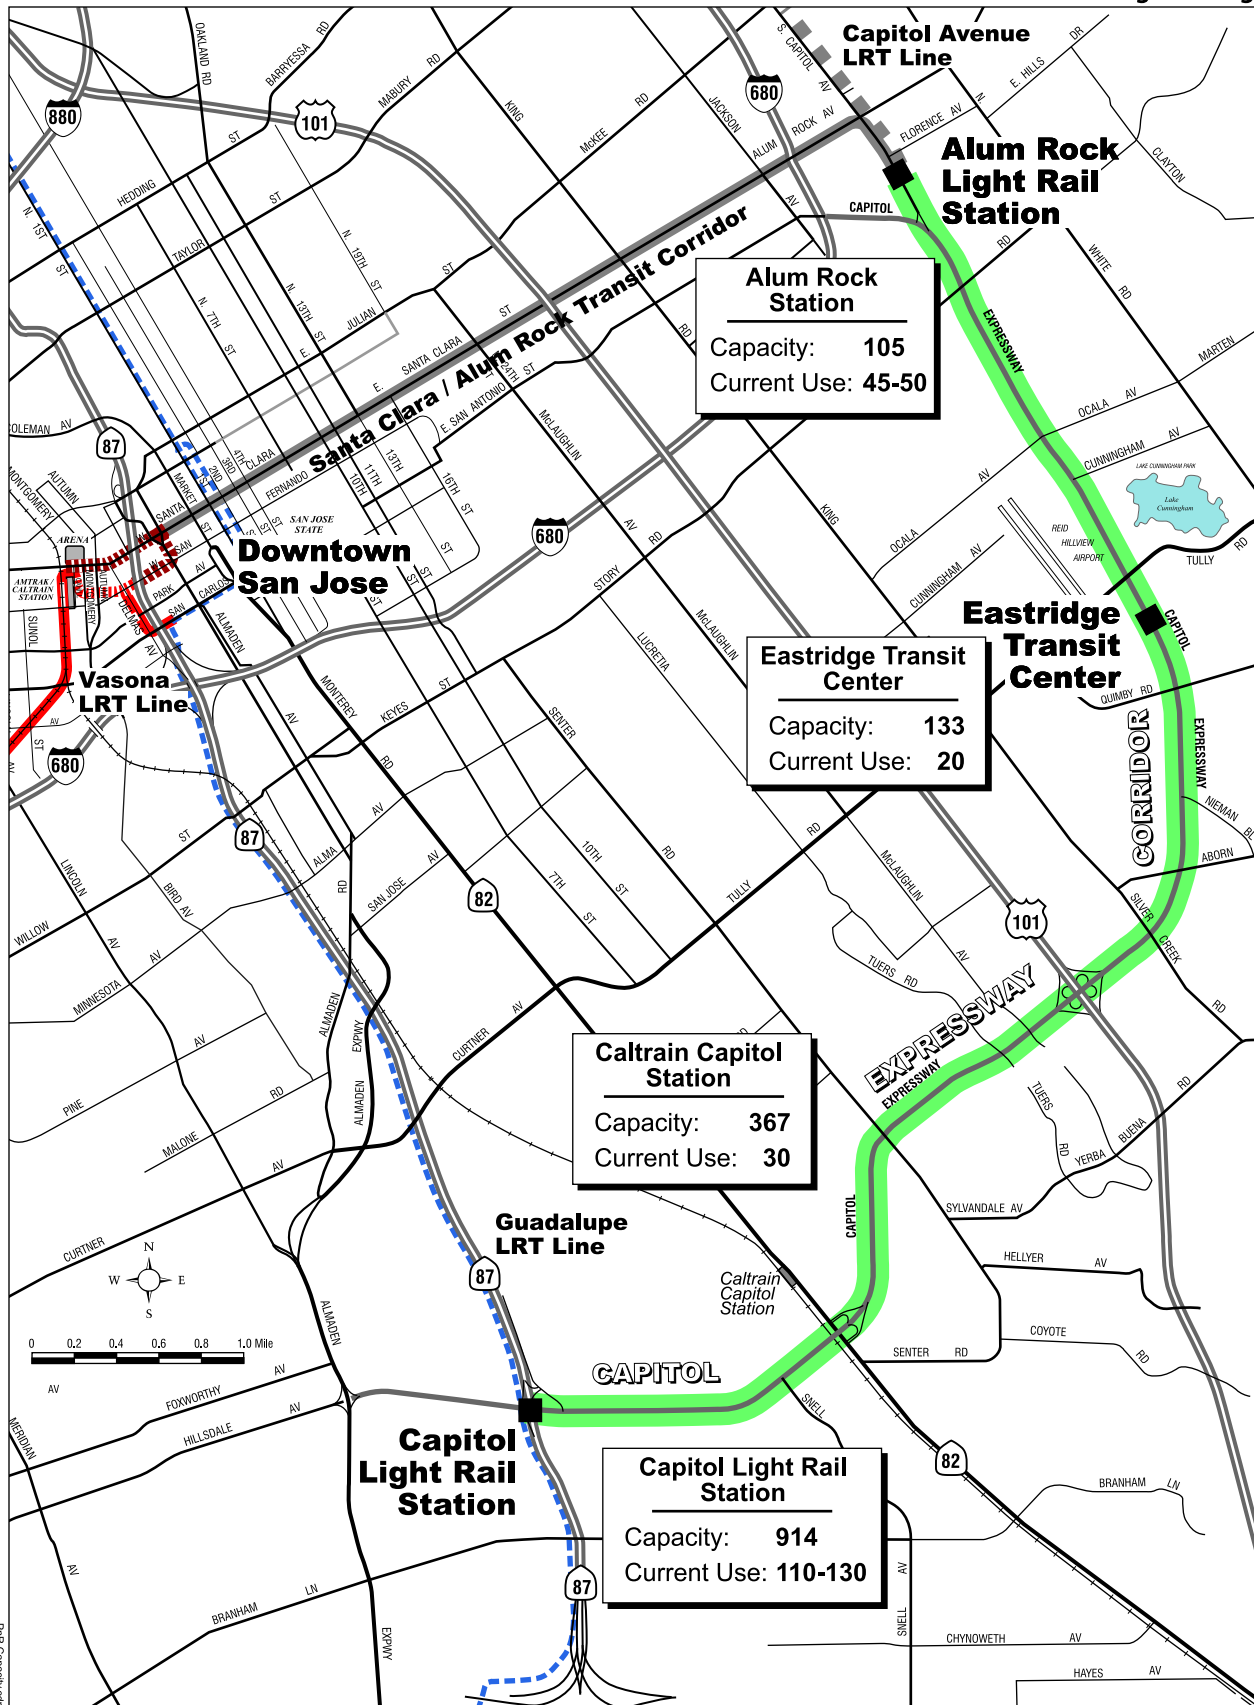

Table 2-14 Details of Existing Facilities

| Location | Size (ft²) | Capacity | Area per Stall (ft²) | Current Peak Use |
|-----------------|------------------------------|-----------------|----------------------------------------|-------------------------|
| Alum Rock | 45,000 | 105 | 425 | 50 |
| Eastridge | 61,200 | 133 | 460 | 20 |
| Capitol (SR 87) | 474,900 | 914 | 520 | 130 |
| Caltrain | 142,600 | 367 | 390 | 30 |

2.5 Pedestrians & Bicycles

Pedestrian and bicycle activity on Capitol Expressway is fairly limited by the corridor's automobile-dominated nature. The most recently developed areas provide more amenities for pedestrians and bicyclists than the earlier developments. As a result, facilities are more abundant in the corridor segments through the Evergreen neighborhoods and between Monterey Highway and SR 87.

Foot-travel along the corridor is limited due to discontinuous sidewalks and pedestrian crossings only at signalized intersections. The only segments of the corridor with fairly continuous concrete sidewalks lie from Nieman Boulevard to Highway 101 and from Monterey Highway to SR 87. The lack of sidewalks is particularly acute on the northern segments of the corridor where the only sidewalks run short distances to link cross-streets with bus stops. Frontage roads do, however, offer sidewalks in sections from Capitol Avenue to Ocala Avenue. Available sidewalk facilities are presented in Figure 2-11.

Rev 6/13/03

DOWNTOWN EAST VALLEY CAPITOL EIR
Figure 2-11
PEDESTRIAN FACILITIES

The majority of signalized intersections along the corridor provide for pedestrian crosswalks, although not all approaches to an intersection may permit crossings. The intersections at Capitol Avenue, Nieman Boulevard, McLaughlin Road, and Narvaez Boulevard prohibit pedestrian crossings on one intersection leg. Only the intersection at Eastridge Loop provides no crosswalks or signals for pedestrians in any direction. Table 2-15 and Figure 2-12 summarize the locations of crosswalks and pedestrian push buttons (PPB).

Table 2-15 Capitol Expressway Crosswalk Locations

| Cross Street | Crossing Location at Intersection | | | |
|-------------------------|-----------------------------------|-------|------|------|
| | North | South | East | West |
| Capitol | Yes | No | Yes | Yes |
| Story | Yes | Yes | Yes | Yes |
| Ocala | Yes | Yes | Yes | Yes |
| Cunningham | Yes | Yes | Yes | Yes |
| Tully | Yes | Yes | Yes | Yes |
| Eastridge ¹ | No | No | - | No |
| Quimby | Yes | Yes | Yes | Yes |
| Nieman ¹ | No | Yes | Yes | - |
| Aborn | Yes | Yes | Yes | Yes |
| Silver Creek | Yes | Yes | Yes | Yes |
| McLaughlin ² | No | Yes | Yes | Yes |
| Senter ² | Yes | Yes | Yes | Yes |
| Snell ² | Yes | Yes | Yes | Yes |
| Vista Park ² | Yes | Yes | Yes | Yes |
| Narvaez ² | Yes | No | Yes | Yes |

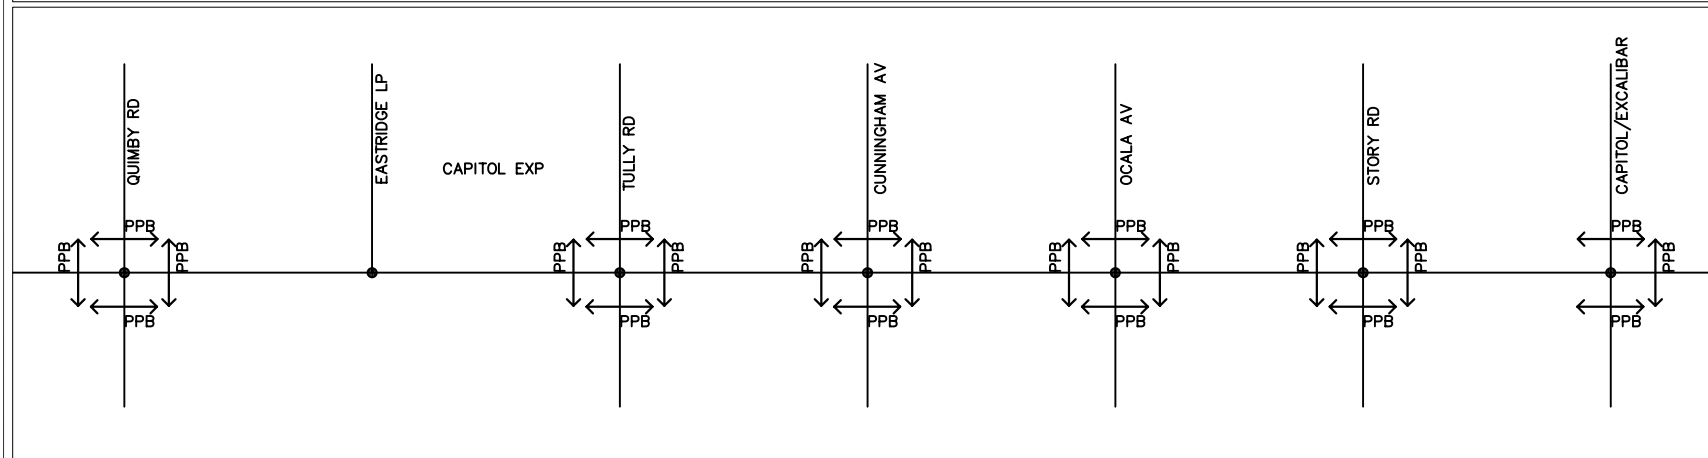

Notes: ¹ Eastridge Loop and Nieman Boulevard meet Capitol Expressway in T-intersections.

² Capitol Expressway is considered to run east-west for the intersections from McLaughlin to Narvaez.

As might be expected in such an automobile-oriented environment, pedestrian crossings are relatively few. Pedestrian use is highest at Story Road and Senter Road where over 250 pedestrian crossings occur during each of the morning and afternoon peak hours. Other intersections with moderate crossing volumes (over 75 in a peak hour) include Ocala Avenue, Silver Creek Road, Seven Trees Boulevard, Snell Avenue, Vista Park Drive, and Copperfield Drive. Pedestrian counts at the signalized intersections are included in Table 2-16.

Bicyclists may use the shoulders along the expressway. Several major cross-streets offer bicycle routes or lanes (Ocala Avenue, Tully Road, Aborn Road, Senter Road, Monterey Highway, Narvaez Avenue). A bicycle path runs along portions of Coyote Creek and access is available from Capitol Expressway at Tuers Road. Figure 2-13 illustrates the bicycle network of the City of San Jose.

Bicycle activity in the study area is low despite the numerous bicycle routes available. The intersections at Senter Road and Snell Avenue have the highest number of bicycle users in the peak hours, although the counts are relatively low even at these locations. Bicycle counts for the major intersections are included in Table 2-17.

2.6 Goods Movement

Capitol Expressway serves the movement of commercial goods into and through the East Valley. Capitol Expressway connects to three freeways (I-680, US 101, and SR 87) and Monterey Highway. The connectivity of the corridor to regional and intrastate facilities accentuates its function as a commercial route. The existing corridor provides for the free flow of commercial traffic except for delays caused by existing traffic congestion. Access into and out of commercial facilities along the corridor is provided by signalized intersections at full movement locations and by right turns only at other minor access points. The spacing of access along the corridor minimizes the need for extensive circulation by commercial traffic onto local streets not specifically designated for such purposes.

2.7 Parking

On-street parking is prohibited on Capitol Expressway. Along the light rail alignment, only the segment on Capitol Avenue south of Wilbur Avenue permits on-street parking. However, parking is temporarily restricted through this section due to the construction of the Capitol Avenue light rail line. Park-and-ride facilities are discussed earlier in this report.

2.8 Community Access

Capitol Expressway serves as the principal thoroughfare in the East Valley study area. As such, it links the various neighborhoods in the corridor and provides access for residents to the amenities and public buildings nearby. Schools, community centers, libraries, cemeteries, major parks, and fire stations are all important features in a community.

Table 2-20 lists the community features in the study area that are near Capitol Expressway. The table also provides the addresses, the nearest major intersections on Capitol Expressway, and the existing access to the features. The maps in Figure 2-14 present the locations of the major community features.

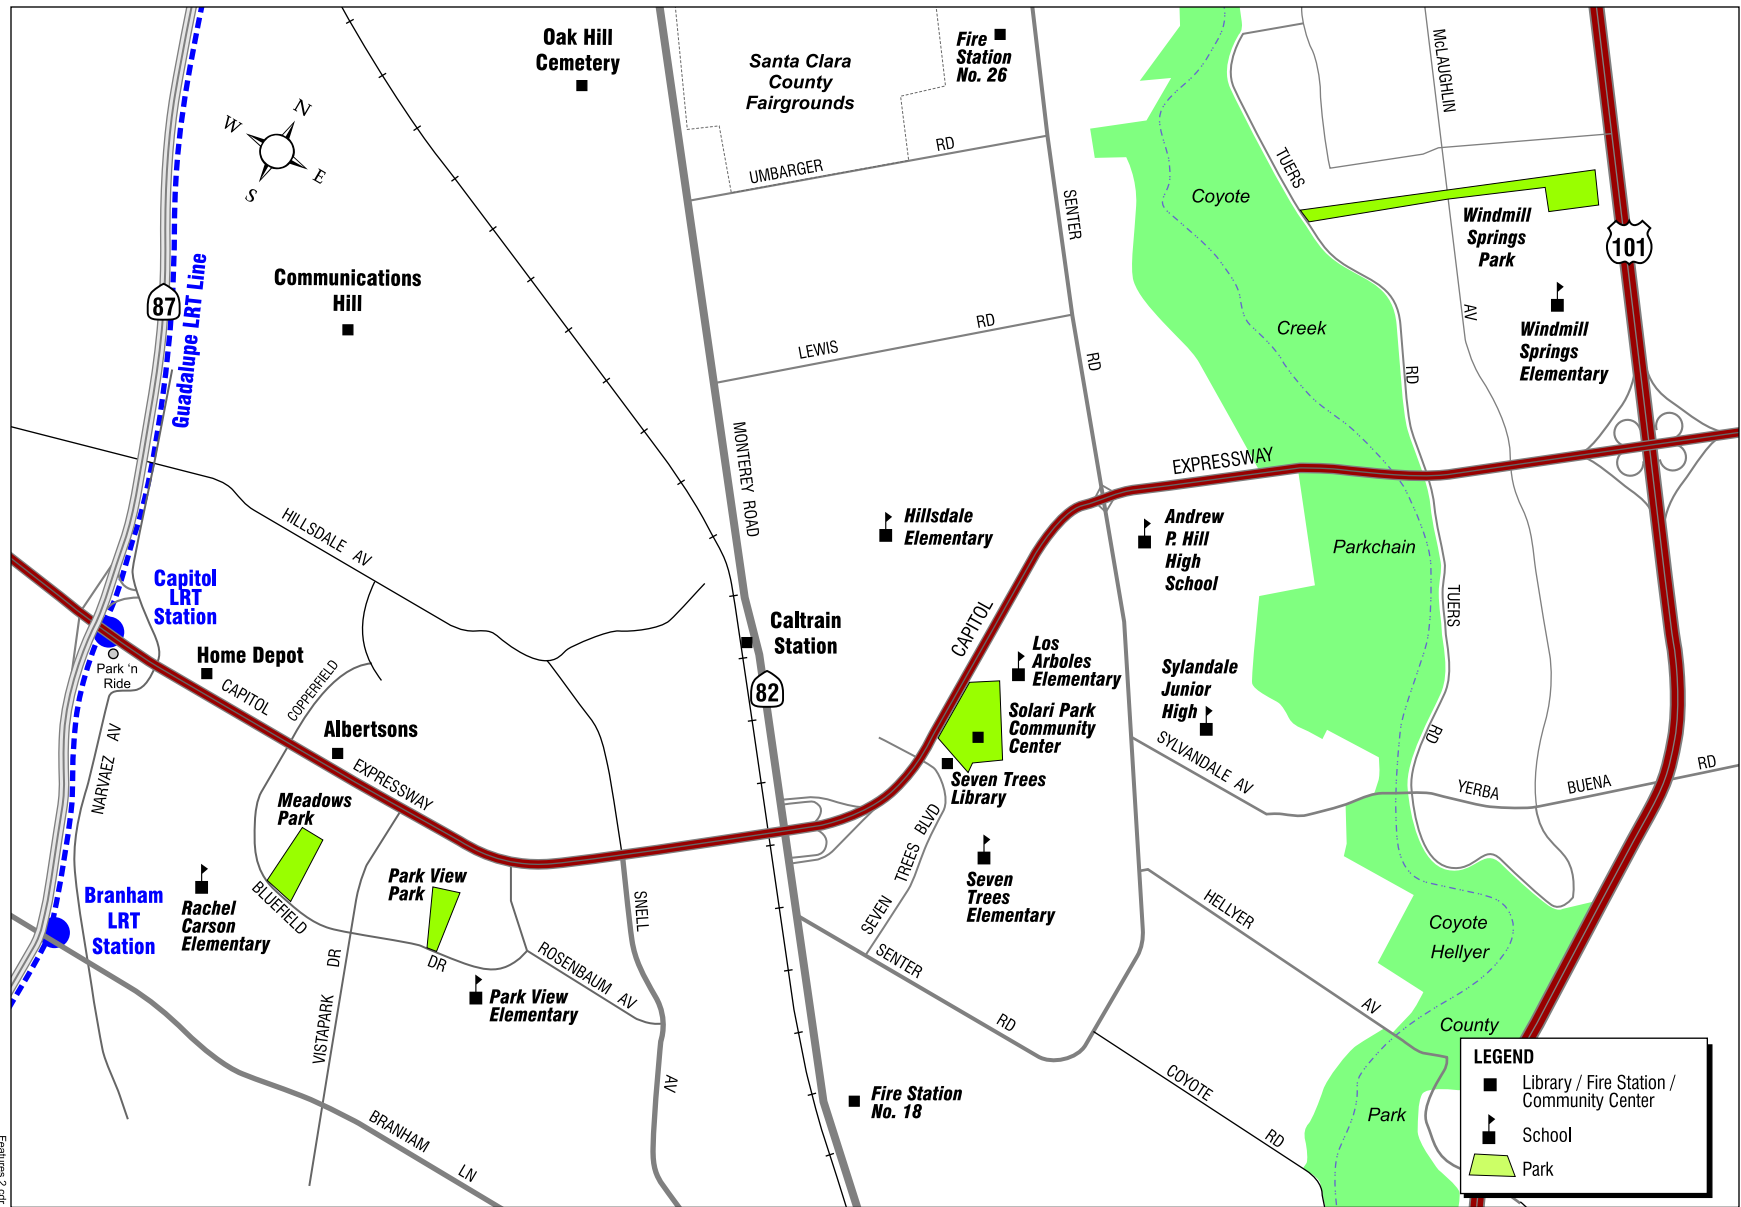

Table 2-20 Community Features Inventory

| Feature | Address (Nearest Major Cross Street) | Capitol Expressway Access |
|---------------------------|--------------------------------------------------|-------------------------------------------------------------------------------------------|
| Elementary Schools | | |
| Donald Meyer | 1824 Daytona Drive (Ocala Avenue) | 0.4 mile west on Ocala Avenue to Daytona Drive |
| Dove Hill | 1460 Colt Way (Silver Creek Road) | 0.3 mile south on Silver Creek Road to Colt Way |
| Hillsdale | 3200 Water Street (Monterey Road) | 0.3 west of Capitol Expwy between Senter Road & Seven Trees Drive; No direct access |
| Holly Oak | 2995 Rossmore Way (White Road) | 0.5 mile east of Capitol Expwy between Quimby & Aborn Roads; No direct access |
| John Montgomery | 2010 Daniel Maloney Drive (Silver Creek Road) | 0.2 mile south on Silver Creek Road to Daniel Maloney Drive |

| Feature | Address (Nearest Major Cross Street) | Capitol Expressway Access |

Features 2.cdr

3.0 FUTURE CONDITIONS

3.1 Objectives

The purpose of an assessment of the future traffic volumes on the corridor is two-fold: it permits a comparison of existing and future traffic operations; and it allows the transportation impacts of the proposed light rail line to be determined with respect to a future No Build Alternative. In this respect, the future transportation benefits and impacts of constructing the light rail line can be identified. Where appropriate, mitigation measures are identified to improve traffic operations.

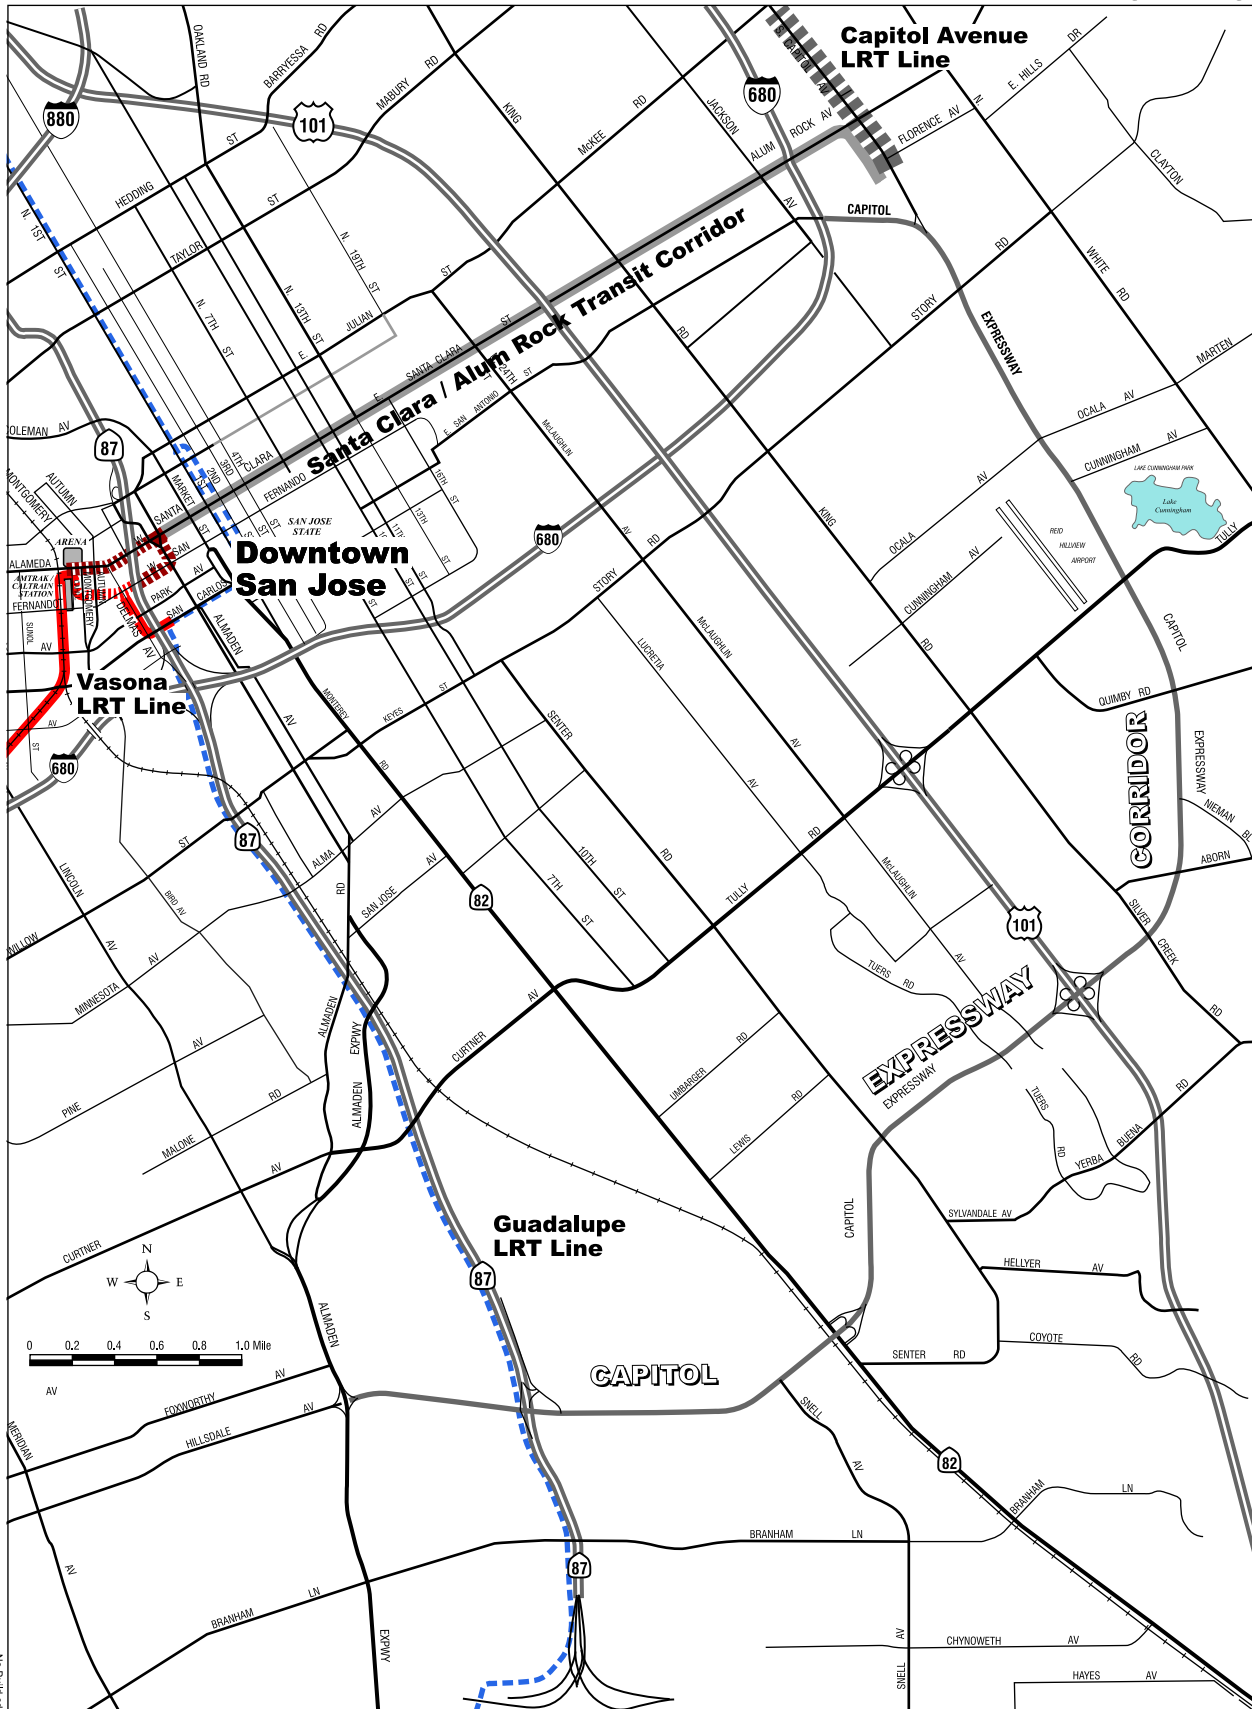

3.2 Future Alternatives

Several alternatives for light rail corridor construction, varying from No Build through full construction, were analyzed for the corridor. Table 3-1 summarizes the alternatives for the Capitol Expressway LRT corridor analyzed in this study. For each of these alternatives, the existing light rail network, the current light rail expansions along the Vasona corridor and Capitol Avenue, and a future transit extension from downtown San Jose to East Valley along Santa Clara and Alum Rock are assumed.

Table 3-1 Light Rail Corridor Alternatives

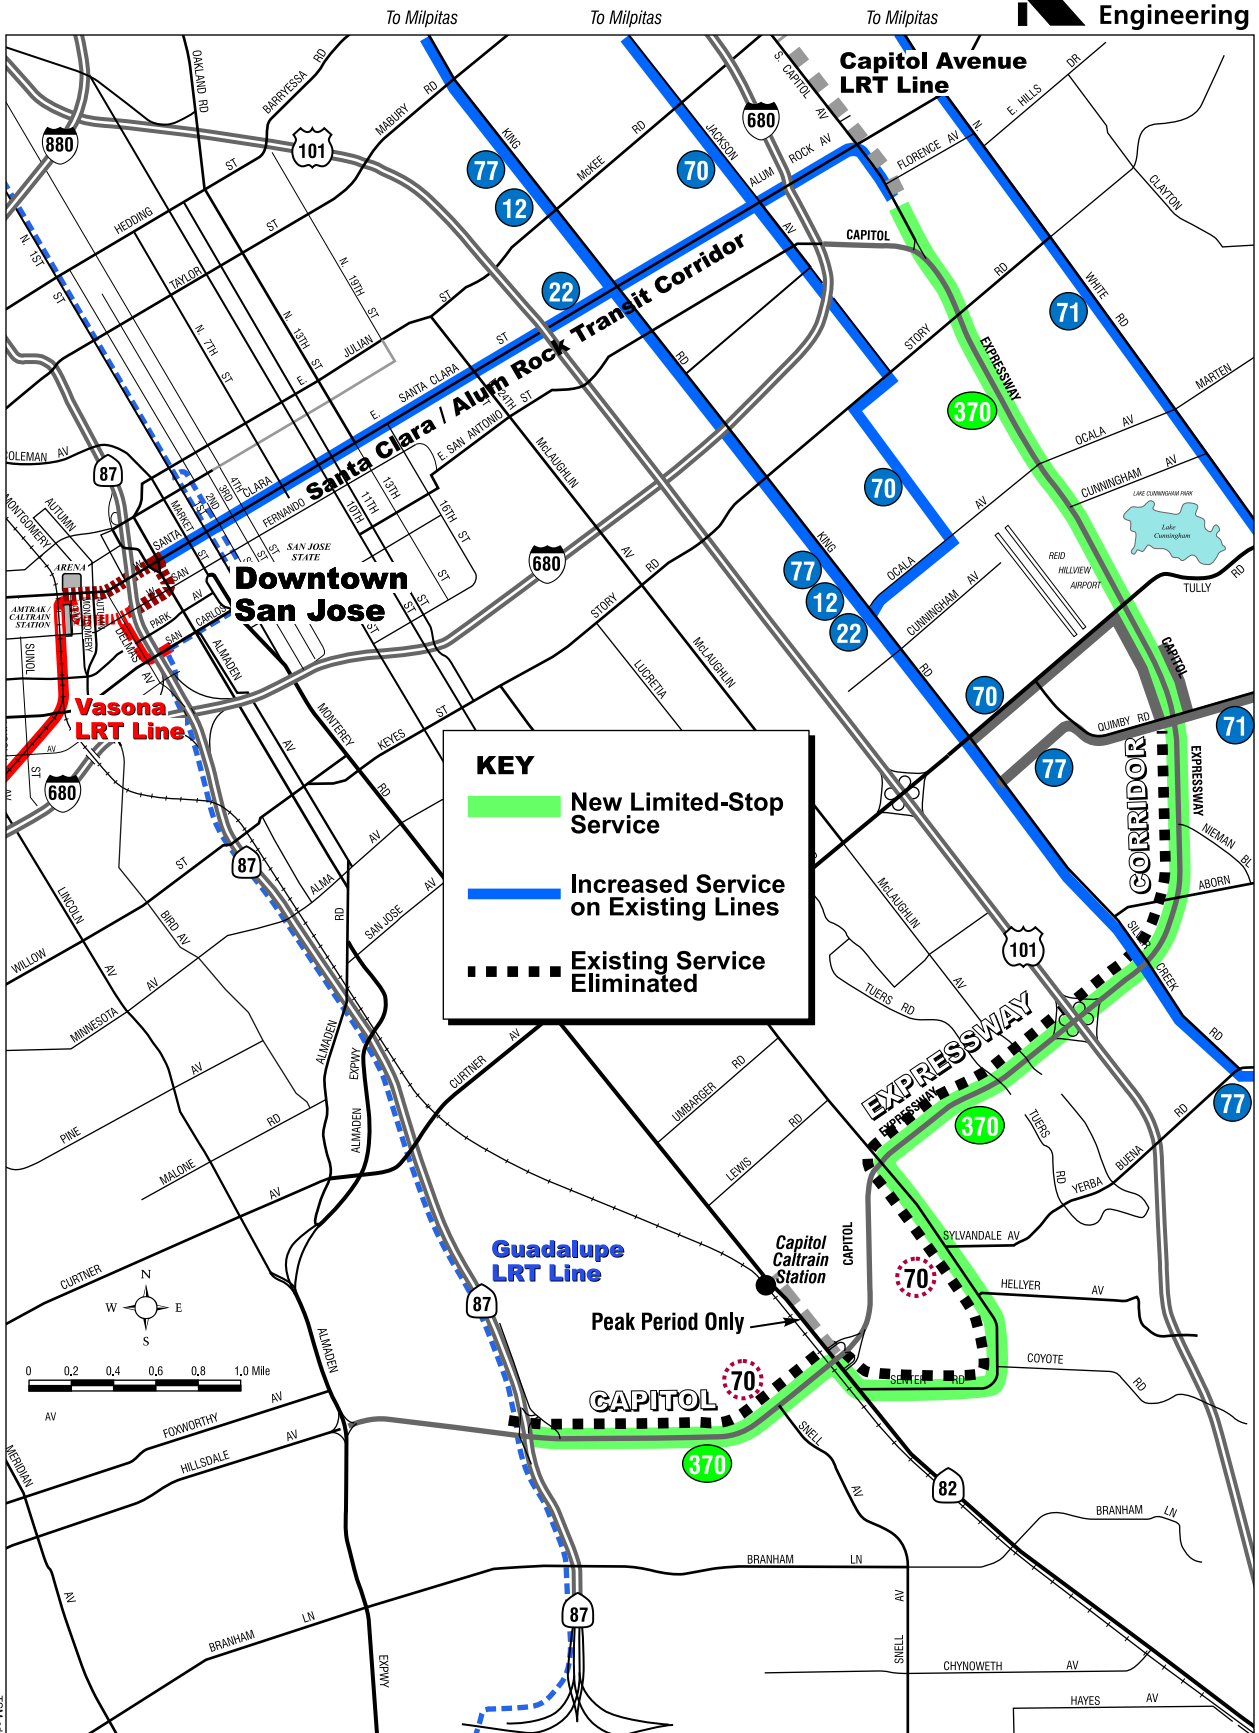

| Description | LRT on Capitol Corridor |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| No Build Alternative | None. |
| Baseline Alternative | None. TSM measures. |
| Light Rail Phase 1 Light Rail Phase 2 | LRT from Alum Rock LRT Station to Eastridge Transit Center. LRT from Eastridge Transit Center Station to SR 87. |

Figure 3-1 to Figure 3-4 show the extent of light rail construction in the study area under each of the alternatives. Figure 3-1 illustrates the No-Build condition. In this scenario the Capitol Avenue light rail line would be built to the Alum Rock station and the Santa Clara/Alum Rock Transit Corridor would operate to the Alum Rock station, but light rail would not be implemented on Capitol Expressway. Figure 3-2 illustrates the Baseline Alternative. Again, the Capitol Avenue light rail would be built to the Alum Rock station and the Santa Clara/Alum Rock line would also be built to the Alum Rock Station. Transportation System Management measures would be implemented on Capitol Expressway (details of the Baseline Alternatives are discussed below). Figure 3-3 illustrates what could be an initial construction phase for light rail along Capitol Expressway with light rail service extended from the Alum Rock Station to Eastridge. Figure 3-4 illustrates the full construction of the light rail project from the Alum Rock station to SR 87. Under both of these later alternatives, transit on Santa Clara/Alum Rock is assumed to be in place.

3.2.1 No Project Alternative

For the purposes of this analysis, the No-Project Alternative does not include transportation improvements to the Capitol Expressway Corridor. It is assumed that transit services offered by VTA within the corridor will continue at current levels, except for limited improvements in service frequency. The No Project Alternative represents the conditions that would be reasonably expected to occur in the foreseeable future if none of the proposed alternatives were implemented.

3.2.2 Baseline Alternative

Federal planning guidelines require that a Baseline Alternative be analyzed. The goal of the Baseline Alternative is to improve mobility along the corridor through enhancements to the existing bus system as an alternative to constructing light rail. The relative benefit of such enhancements can be measured against a “No Build” alternative at one end of the spectrum and “Build light rail” at the other end. The Baseline Alternative is, therefore, the optimal level of bus service that could be provided on the existing roadway without major infrastructure investment.

The proposed Baseline Alternative for the Capitol Expressway corridor would operate using the same basic service structure that is provided today, although enhancements would include modest facility improvements and operations expansion. Major capital expenditures for street reconstruction and widening, property acquisition, and relocation of homes and businesses are not included in the Baseline Alternative.

Enhanced limited-stop (ELS) bus service is one measure of the Baseline Alternative that could have a significant impact on the shape and form of the transit service provided in the study corridors. An ELS bus line is a hybrid of a traditional limited-stop bus line and a fully implemented bus rapid transit (BRT) line. It travels in shared right-of-way, as does a traditional service, but can have amenities that improve passenger comfort and operating conditions that are usually reserved for BRT services. An ELS bus service can offer high-level transit service at a lower cost per trip than light rail.

The proposed Line 370 would provide continuous limited-stop service along Capitol Expressway between Alum Rock Station and Capitol Station. It would link the Capitol Avenue Light Rail Line with the Guadalupe Light Rail Line. Line 370, however, would deviate from Capitol Expressway to serve a portion of Senter Road and Monterey Highway (as the existing Line 70 does today). As well, some of its peak period trips could be diverted to serve the Capitol Caltrain Station.

In conjunction with the introduction of limited-stop service with the above-mentioned Line 370, Line 70 is proposed to terminate its service at Eastridge Transit Center, continuing to serve only the northern portion of the route to Milpitas. Passengers wishing to travel south of Eastridge Transit Center would use the proposed Line 370 limited-stop service.

Service on the Line 70 between Eastridge Transit Center and Milpitas, as well as other lines, could be increased to accommodate the high levels of passenger activity on parallel and

intersecting corridors, such as King Road, Jackson Avenue, and White Road. Evening and weekend services could also be increased. The following bus lines could have their service levels increased:

- Line 70: Milpitas – Eastridge;
- Line 71: Milpitas – Eastridge; and,
- Line 77: Milpitas – Evergreen College.

Traffic congestion often impacts the efficiency of transit operations and can serve as a deterrent to potential transit passengers who perceive bus travel as time-consuming and unfavorable when compared to auto travel. Transit priority measures can permit buses to avoid automobile congestion and can provide buses with preferential consideration at traffic. The following priority measures could be implemented as a part of the Capitol Expressway Corridor Baseline Alternative:

- Existing HOV lanes would remain for use by both automobiles and buses;
- Queue jump and bus-only lanes could be implemented, where feasible; and
- Signal priority and coordination could be implemented along the entire corridor.

3.2.3 Light Rail Alternative

The proposed Light Rail Alternative would extend 8.2 miles south and west from the existing terminus of the Capitol Avenue LRT Line at the Alum Rock Station to the Eastridge Transit Center, and continue to the existing Guadalupe LRT Line at SR 87.

The alignment would operate in exclusive and semi-exclusive rights-of-way and would include both grade-separated and at-grade intersection crossings. The alignment would operate primarily in the median of Capitol Expressway; however, some short alignment sections and options would deviate from the median.

The proposed Light Rail Alternative would be designed to reduce transit travel time with signal priority at intersections and grade separation at congested intersections. Crossings at freeways, expressways and some major arterials would also be grade-separated (either elevated or depressed) to further support higher-speed transit operations.

Construction of the light rail guideway and grade-separated structures under this alternative would alter the roadway geometry along some portions of Capitol Expressway. Perhaps the most dramatic design change to the expressway would be the removal of existing HOV lanes between Capitol Avenue and US 101 to provide the additional right-of-way to accommodate the light rail project.

The Light Rail Alternative would likely be constructed in two or more phases; initial phase terminating in the vicinity of the Eastridge Transit Center and subsequent phases continuing to the Guadalupe LRT Line at SR 87.

3.2.4 Person Through volume on Capitol Expressway

To construct light rail within the existing Capitol Expressway right-of-way a lane of traffic must be removed between Capitol Avenue and US 101. The lane to be removed could either be the high occupancy vehicle lane in each direction or a general purpose lane (a lane open to any vehicle occupancy size). The analysis in this section illustrates the difference in total person through volume by removing an HOV lane versus removing a general purpose travel lane.

Table 3-2 illustrates the person through volume on Capitol Expressway at Story Road during the AM peak for five different scenarios. These scenarios are described below.

Table 3-2 Person through Volume on Capitol Expressway at Story Road

| Configuration | Vol/Occ/Total | Northbound AM Peak | | | |
|-----------------------------------------------|--------------------------------------|-------------------------------------------------|---------------------|------------------------------|-----------------------------|
| | | Solo Drivers | HOVs | Transit | Total Person Through Volume |
| Existing ¹ 3 GPLs + 1 HOV | Volume Occupancy Total Persons | 2,830 1.0 2,830 | 554 2.2 1220 | 2 15 30 | 4,080 |
| 3 GPLs + LRT To Eastridge | Volume Occupancy Total Persons | 2,880 ² 1.2 ³ 3,455 | N/A | 6 85 510 ⁴ | 3,965 |
| 3 GPLs + LRT to SR 87 | Volume Occupancy Total Persons | 2,880 ² 1.2 ³ 3,455 | N/A | 6 145 870 ⁴ | 4,325 |
| 2 GPLs 1 HOV LRT to Eastridge | Volume Occupancy Total Persons | 1,920 ² 1.0 1,920 | 554 2.2 1,220 | 6 85 510 ⁴ | 3,650 |
| 2 GPLs 1 HOV LRT to SR 87 | Volume Occupancy Total Persons | 1,920 ² 1.0 1,920 | 554 2.2 1,220 | 6 145 870 ⁴ | 4,010 |

Notes:

¹ Existing data from Capitol Expressway Study (on-going Spring, 2003)

² Per lane capacity is 960 vehicles per lane or 80 seconds of green per 150 second cycle

³ Weighted average occupancy assumes 80% of carpools remain from current observation

⁴ Inbound AM loadings from Capitol Expressway LRT Study

EXISTING – 3 GENERAL PURPOSE LANES (GPLS) AND 1 HIGH OCCUPANCY VEHICLE LANE (HOV)

The existing condition is three general purpose lanes and one high occupancy vehicle lane. The volumes and occupancies for the existing condition were obtained from the Capitol Expressway Study (ongoing Spring 2003) by County Roads and Airports. The existing total person through volume is 4,080.

3 GENERAL PURPOSE LANES AND LIGHT RAIL TO EASTRIDGE

This scenario assumes the HOV lane is removed and light rail is constructed to Eastridge. The GPLs are assumed to have a capacity of 960 vehicles per lane. This assumes a saturation flow rate of 1,800 vehicles per lane per hour of green and a green phase for the northbound through of 80 seconds out of a 150-second cycle.

This alternative assumes that 80 percent of the existing carpools remain, since they can use other HOV lanes on the roadway network as part of their trip, or they are carpools of necessity. The resulting weighted average occupancy is 1.2 persons per vehicle, approximately the average occupancy throughout the region.

The AM peak hour northbound light rail ridership has previously been estimated at 510 per hour in 2010, or 85 passengers per 2-car train for a light rail project terminating at Eastridge. It should be noted that light rail could easily accommodate over 2,000 hourly passengers in a 2-car train with 10-minute headways.

The total person through volume for this configuration is 3,965, or about a 3 percent reduction from existing through volume. (Please note that the light rail ridership projections are 2010 and not existing. Existing demand, if projected, would be slightly less.)

3 GENERAL PURPOSE LANES AND LIGHT RAIL TO SR 87

Extending light rail to SR 87 attracts additional ridership. The northbound AM peak hour demand at Story Road has previously been projected at 870 passengers, or 145 passengers per 2-car train. The total person through volume at Story Road then becomes 4,325 persons, or 6 percent greater than existing through volume.

2 GENERAL PURPOSE LANES, 1 HOV AND LIGHT RAIL TO EASTRIDGE

This geometric configuration assumes that the existing HOV lane remains and a general purpose lane is removed for construction of light rail. The capacity of the 2 GPLs are assumed at 960 vehicles per lane, as documented above, and the HOV lane volume is assumed at existing. The light rail volumes are the 2010 projections for an initial phase to Eastridge.

With this configuration the total person through volume is 3,650, or a 12 percent reduction from existing and an almost 9 percent reduction from the configuration that removes the HOV lane and keeps 3 GPLs.

2 GENERAL PURPOSE LANES, 1 HOV AND LIGHT RAIL TO SR 87

Extending light rail to SR 87 and maintaining the HOV lane results in a northbound person through volume at Story Road of 4,010. This presents a less than 2 percent decline from existing and about an 8 percent reduction from the configuration that removes the HOV lane and keeps 3 GPLs.

CONCLUSION

The existing roadway carries just under 4,100 persons per hour northbound on Capitol Expressway at Story Road in the AM peak hour. This section was selected as a typical portion of the expressway and similar volume characteristics would occur on other parts of the expressway. If light rail is constructed by replacing the HOV lane, the carrying capacity of the roadway stays near the existing volume (3,965 to 4,325 persons per hour). If instead, the light rail project replaces a general purpose travel lane in each direction, the through volume capacity drops (3,650 to 4,010 persons per hour).

3.3 Travel Times and Speeds on Capitol Expressway

The roadway and light rail travel times and speeds have been estimated for Capitol Expressway both with and without the light rail project. The travel times and speeds are summarized in Table 3-3.

Table 3-3 Capitol Corridor Travel Time and Speed Data

| Intersection | Distance (miles) | Traveling Northbound | | | | Traveling Southbound | | | |
|------------------------------------------------------------|------------------|----------------------|-------------|-------------------|-------------|----------------------|-------------|-------------------|-------------|

M = mixed flow travel lanes

H = carpool (HOV) lane

The corridor has been separated into three segments. The first segment is from Alum Rock to Tully. The second segment is from Tully to McLaughlin. The third segment is from McLaughlin to SR 87. Travel times and speeds are noted for each segment, during each peak hour, and in each direction along the corridor. Total travel times and speeds are also noted on Table 3-3.

The top section of Table 3-3 indicates the existing travel times along the corridor. In the northbound direction during the AM peak hour, the total travel time is 20.8 minutes and in the southbound direction the total travel time is 23.7 minutes. During the PM peak hour, the northbound travel time is 21.2 minutes and the southbound travel time is 17.8 minutes.

The next section of Table 3-3 is the 2010 No Build condition. The roadway geometry is identical to the existing condition. The travel times are increased and the travel speeds are decreased over the existing conditions because of an increase in traffic volumes.

The next group of travel times and speeds represents the condition where the light rail project replaces the two HOV lanes. Generally, the travel times increase slightly and the travel speeds decrease slightly. Northbound in the PM peak hour, the travel time decreases with the project. The decrease in travel times results from the light rail having priority over the traffic signals along the corridor which provides a benefit to through travel. In the case of northbound travel in the PM peak hour, the benefit of signal priority outweighs the loss of the HOV lane.

The next group of travel times and speeds are the 2025 No Build Condition. The roadway geometry is identical to the Existing Conditions with additional traffic representing the 2025 timeline. Overall, the travel speeds are slower and the travel times greater than for any of the 2010 scenarios.

The next group of travel times and speeds represents the 2025 condition with construction of the light rail project. Generally, the travel times increase over the 2025 No Project condition. The effect of light rail signal priority is evident for southbound travel in the AM peak hour where the travel times and speeds are identical for the 2025 No Project and 2025 With Project conditions.

The last group of travel times and speeds on Table 3-3 are for light rail. Light rail operates in semi-exclusive right-of-way and is only affected by automobile traffic at the intersections. Light rail will have signal priority at the intersections and, therefore, travels faster than adjacent automobile traffic. Travel times for light rail will be consistent between 2010 and 2025.

3.4 CEQA Significance Thresholds

3.4.1 Traffic Impact Significance Criteria

The traffic impact significance criteria vary with jurisdiction and are detailed below. Table 3-4 summarizes the significance criteria for the Congestion Management Program, the City of San Jose, and VTA. It should be noted that the City's criteria apply to all intersections in San Jose, including CMP intersections.

3.5 Traffic Impacts

The traffic impacts of the Baseline Alternative and the two phases of the LRT Alternative were assessed for the AM and PM peak hours for the 2010 and 2025 horizons. The Baseline Alternative and the two phases of the LRT Alternatives were compared to the No Build Alternative to determine the effects of the Project. The following is a summary of the Baseline and LRT Alternative impacts for each design horizon.

There are several intersections that operate at congested levels indicated by Levels of Service E or F. During the AM peak hour in 2010, seven intersections operate at level of service E or F for the No Project Alternative. The same seven intersections also operate at level of service E or F for the Baseline Alternative. One additional intersection operates at level of service E with the light rail alternatives. During the PM peak hour in 2010, seven intersections operate at level of service E or F for the No Build Alternative. These same seven intersections operate at level of Service E or F for the Baseline Alternative. One additional intersection operates at level of service E with the light rail alternatives.

Similarly, in 2025 several intersections operate at level of service E or F. During the AM peak hour eight intersections operate at level of service E or F for the No Build Alternative. Nine intersections operate at level of service E or F for the Baseline Alternative and for both phases of the Light Rail Alternative. During the PM peak hour in 2025, eight intersections operate at level of service E or F for the No Build. These same eight intersections operate at level of service E or F for the Baseline Alternative and for the first phase of the Light Rail Alternative. One additional intersection operates at congested levels for the second phase of the Light Rail Alternative. Traffic operations at congested levels for any alternative does not represent a significant impact requiring mitigation. Significant impacts are defined by the criteria established in Section 3.4. Traffic operations are defined by level of service (A through F) which are based on the average stopped delay for all vehicles traveling through an intersection. Level of service and the associated delay values were previously defined in Table 2-3. Traffic impacts also use volume-to-capacity ratios (V/C) to determine significant impacts. The V/C is a simple numeric value of the traffic volume through the intersection divided by the intersection capacity.

Table 3-4 Impact Significance Criteria

| | Significance Criteria |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TRAFFIC | |
| CMP | LOS declines from LOS E or better for 'No Project' condition to LOS F for 'With Project' condition; or, Critical movement delay increases by four seconds or more <i>and</i> volume-to-capacity ratio increases by 0.01 or more at intersections already operating at LOS F under background conditions. |
| City of San Jose | LOS declines from LOS D or better for 'No Project' condition to LOS E or F for 'With Project' condition; or, Critical movement delay increases by four seconds or more <i>and</i> volume-to-capacity ratio increases by 0.01 or more at intersections already operating at LOS E or F under background conditions. |
| VTA | Cause an intersection's LOS to deteriorate from LOS E (when compared to "No Project"); Cause an increase in the critical volume delay by four seconds or more <i>AND</i> increase the critical v/c ratio by 0.01 or more at an intersection already operating at LOS F under "No Project" conditions; Result in a change of two letter grades at an intersection operating at LOS A or B under "No Project" conditions; Add new trips totaling more than one percent of the freeway capacity if a freeway segment is already operating at LOS F Cause a substantial increase in regional vehicle miles traveled (VMT) or vehicle hours traveled (VHT); Cause a substantial diversion of traffic onto a residential street; and, Substantially disrupt traffic operations and/or substantially affect emergency vehicle response. |
| PARKING | |
| VTA | Parking Impacts are generally considered significant by VTA if the proposed project would result in: Loss of parking spaces such that the loss results in substantial adverse economic impacts to businesses in the area; A park-and-ride lot where demand is projected to be 105% or more of the lot's planned capacity. |
| PEDESTRIAN & BICYCLE ACCESSIBILITY | |
| VTA | Create particularly hazardous conditions for bicyclists or eliminate bicycle facilities, and adequate facilities do not remain to serve the community's needs Result in substantial overcrowding on public sidewalks, create hazardous conditions for pedestrians, or eliminate pedestrian access to adjoining areas. |

Sources: CMP, City of San Jose, VTA

Note: City of San Jose and VTA draft criteria apply to all intersections in San Jose, including CMP intersections. Santa Clara County follows CMP criteria.

3.5.1 2010

Table 3-5 summarizes the 2010 AM peak hour traffic operational conditions for the No Build, Baseline Alternative, the first phase of the LRT to Eastridge Alternative, and a second phase of the LRT Alternative to SR 87. Intersections that are significantly impacted are shaded in the table. Table 3-6 shows the PM peak hour traffic operational conditions for the same four alternatives. Again, the significantly impacted intersections are shaded. The future traffic volumes are illustrated graphically in Appendix D. The Project minimum green times and green time adjustments are shown in Appendices E and F respectively. Finally, the TRAFFIX level of service summary sheets are contained in Appendix G.

3.5.1.1 Baseline Alternative

The Baseline Alternative impacts two intersections, both in the AM peak hour. The following is a summary of these impacts.

- Capitol Expressway/Story Road – This intersection is significantly impacted in the AM peak hour by the Baseline Alternative. The delay value and volume to capacity ratio are exceeded for an intersection already operating at level of service F. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.
- Capitol Expressway/Senter Road – This intersection is significantly impacted in the AM peak hour by the Baseline Alternative. The delay value and volume to capacity ratio are exceeded for an intersection already operating at level of service F. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.

3.5.1.2 Light Rail Alternative Phase 1 -- Build to Eastridge

The Light Rail Alternative Phase 1 to Eastridge impacts three intersections, two during both peak hour and one during the PM peak hour only. The following is a summary of these impacts.

- Capitol Expressway/Story Road – This intersection is significantly impacted in both the AM and PM peak hours by the Project. The delay value and volume to capacity ratio are exceeded for an intersection already operating at level of service F. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.
- Capitol Expressway/Ocala Road – This intersection is significantly impacted in the PM peak hour by the Project. The level of service changes from level of service D without the Project to level of service E with the Project. This exceeds the significance criteria for the City of San Jose.
- Capitol Expressway/Tully Road – This intersection is significantly impacted during both the AM and PM peak hours by the Project. During the AM peak hour the level of service changes from D without the Project to E with the Project. This exceeds the significance criteria of the City of San Jose. During the PM peak hour the level of service changes from level of service E without the Project to level of service F with the Project. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.

3.5.1.3 Light Rail Alternative Phase 2 – Build to SR 87

The Light Rail Alternative Phase 2 to SR 87 impacts six intersections, four during both peak hours, one during the AM peak hour only, and one during the PM peak hour only. The following are a summary of these impacts.

- Capitol Expressway/Story Road – This intersection is impacted during both the AM and PM peak hours by the Project. The delay value and volume to capacity ratio are exceeded for an intersection already operating at level of service F. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.
- Capitol Expressway/Ocala Avenue -- This intersection is significantly impacted in the PM peak hour by the Project. The level of service changes from level of service D without the Project to level of service E with the Project. This exceeds the significance criteria for the City of San Jose.
- Capitol Expressway/Tully Road – This intersection is significantly impacted during both the AM and PM peak hours by the project. During the AM peak hour the level of service changes from D without the Project to E with the Project. This exceeds the significance criteria of the City of San Jose. During the PM peak hour the level of service changes from E without the Project to F with the Project. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.
- Capitol Expressway/Aborn Road – This intersection is significantly impacted by the Project during both the AM and PM peak hours. During the AM peak hour the delay value and volume to capacity ratio are exceeded for an intersection already operating at level of service F. This exceeds the significance criteria for CMP, the City of San Jose, and VTA. During the PM peak hour the delay value and volume to capacity ratio are exceeded for an intersection already operating at level of service E. This exceeds the significance criteria of the City of San Jose.
- Capitol Expressway/Silver Creek Road – This intersection is impacted during both the AM and PM peak hours by the Project. The delay value and volume to capacity ratio are exceeded for an intersection already operating at level of service F. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.
- Capitol Expressway/McLaughlin Avenue – This intersection is impacted during the AM peak hour by the Project. The level of service changes from level of service E to level of service F with the Project. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.

3.5.2 2025

Table 3-7 summarizes the 2025 AM peak hour traffic operational conditions for the No Build, Baseline Alternative, Light Rail to Eastridge, and Light Rail to SR 87 phases. Intersections that are significantly impacted are shaded in the table. Table 3-8 shows the PM peak hour traffic operational conditions for the same alternatives. Again, the significantly impacted intersections are shaded.

Table 3-7 Intersection LOS, Delay and V/C – 2025 AM

■ Shaded cells indicate significant impacts.

3.5.2.1 Baseline Alternative

The Baseline Alternative impacts three intersections, all in the AM peak hour. The following is a summary of these impacts.

- Capitol Expressway/Ocala Avenue – This intersection is impacted during the AM peak hour by the Baseline Alternative. The level of service changes from level of service D to level of service E. This exceeds the significance criteria of the City of San Jose
- Capitol Expressway/Aborn Road – This intersection is impacted during the AM peak hour by the Baseline Alternative. The delay value and volume to capacity ratio are exceeded for an intersection already operating at level of service F. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.
- Capitol Expressway/Senter Road -- This intersection is significantly impacted in the AM peak hour by the Baseline Alternative. The delay value and volume to capacity ratio are exceeded for an intersection already operating at level of service F. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.

3.5.2.2 Light Rail Alternative Phase 1 – Build to Eastridge

The Light Rail Alternative Phase 1 to Eastridge impacts four intersections, three during both peak hours and one during the PM peak hour only. The following is a summary of these impacts:

- Capitol Expressway/Capitol Avenue – This intersection is impacted during the PM peak hour by the Project. The delay value and volume to capacity ratio are exceeded for an intersection already operating at level of service F. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.
- Capitol Expressway/Story Road – This intersection is significantly impacted in both the AM and PM peak hours by the Project. The delay value and volume to capacity ratio are exceeded for an intersection already operating at level of service F. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.
- Capitol Expressway/Ocala Road – This intersection is significantly impacted in the both the AM and PM peak hours by the Project. The level of service changes from level of service D without the Project to level of service E with the Project. This exceeds the significance criteria for the City of San Jose.
- Capitol Expressway/Tully Road – This intersection is significantly impacted during both the AM and PM peak hours by the Project. During the AM peak hour the level of service changes from D without the Project to E with the Project. This exceeds the significance criteria of the City of San Jose. During the PM peak hour the level of service changes from level of service E without the Project to level of service F with the Project. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.

3.5.2.3 Light Rail Alternative Phase 2 -- Build to SR 87

The Light Rail Alternative Phase 2 to SR 87 impacts eight intersections, six during both peak hours, and two during the PM peak hour only. The following are a summary of these impacts.

- Capitol Expressway/Capitol Avenue – This intersection is impacted during the PM peak hour by the Project. The delay value and volume to capacity ratio are exceeded for an intersection already operating at level of service F. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.
- Capitol Expressway/Story Road – This intersection is impacted during both the AM and PM peak hours by the Project. The delay value and volume to capacity ratio are exceeded for an intersection already operating at level of service F. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.
- Capitol Expressway/Ocala Avenue -- This intersection is significantly impacted by the Project in both the AM and PM peak hours by the Project. During the AM the level of service changes from level of service D without the Project to level of service E with the Project. This exceeds the significance criteria of the City of San Jose. During the PM peak hour the delay value and volume to capacity ratio are exceeded for an intersection operating at level of service E. This also exceeds the significance criteria of the City of San Jose.
- Capitol Expressway/Tully Road – This intersection is significantly impacted during both the AM and PM peak hours by the project. During the AM peak hour the level of service changes from D without the Project to E with the Project. This exceeds the significance criteria of the City of San Jose. During the PM peak hour the level of service changes from E without the Project to F with the Project. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.
- Capitol Expressway/Quimby Road – This intersection is significantly impacted by the Project in both the AM and PM peak hours. During the AM peak hour the level of service changes from level of service E to level of service F. During the PM peak hour the delay value and volume to capacity ratio are exceeded for an intersection already operating at level of service F. These options exceed the significance criteria for CMP, the City of San Jose, and VTA.
- Capitol Expressway/Aborn Road – This intersection is significantly impacted by the Project during both the AM and PM peak hours. The delay value and volume to capacity ratio are exceeded for an intersection already operating at level of service F. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.
- Capitol Expressway/Silver Creek Road – This intersection is impacted during both the AM and PM peak hours by the Project. The delay values and volume to capacity ratios are exceeded for an intersection already operating at level of service F. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.

- Capitol Expressway/McLaughlin Avenue – This intersection is impacted during the PM peak hour by the Project. The level of service changes from level of service D to level of service E with the Project. This exceeds the significance criteria of the City of San Jose.

3.5.3 Design Options

Five design options to the Project have been assessed with respect to traffic operations. These design options and the associated level of service are discussed below.

3.5.3.1 Pedestrian Grade Separation at Story Road.

The base option assumed that light rail passengers at Story Road would access the platform by crossing at-grade into the median of the expressway and accessing the platform via stairs or elevators. An option has also been developed whereby light rail passengers would access the platforms via pedestrian overcrossings. This would reduce the number of pedestrian actuated signal phases.

The analysis found that no change in intersection level of service would result with pedestrians crossing onto the light rail platforms via grade separation because the time required to serve the Story Road cross street traffic is sufficient to also serve the pedestrian traffic.

3.5.3.2 Single Southbound Left Turn at Ocala Avenue

To reduce the amount of right-of-way takes required by the Light Rail Alternatives a design option considered eliminating one of the southbound left turn lanes at Ocala Avenue. This option increased the average vehicle delay in 2010 from 36.8 to 51.2 in the AM peak and from 43.2 to 54.6 in the PM peak. In 2025 the increased delay is from 47.2 to 70.3 in the AM peak and from 57.9 to 77.6 in the PM peak. This exceeds the significance criteria for CMP, the City of San Jose, and VTA.

3.5.3.3 Light Rail Side Running At-Grade at Eastridge Road and Quimby Road

Another option considered maintaining light rail side running from Eastridge into the Arcadia property (currently a vacant 89-acre parcel approximately 1,300 feet south of Quimby Road on the west side of Capitol Expressway) before it would transition back into the median of the expressway. The crossing of Eastridge Road and Quimby Road at-grade would affect traffic operations. Additionally, these crossings would need to be gated and when light rail arrived the signals would be pre-empted in order to clear any auto vehicles on the tracks. This would interrupt the signal progression along Capitol Expressway and because of the frequency of light rail movements, returning to progressive traffic movements after light rail had passed would be unlikely. With light rail operating on 10 minute headways, a train will affect every other cycle. Because it will take up to two signal cycles to return to progression, side running operations will, in effect, prevent signal progression for this portion of the corridor. This would represent a significant impact for the at-grade option.

3.5.3.4 Grade Separation at Aborn Road

An option is being considered that grade separates the light rail corridor at Aborn Road. With at-grade operations of light rail through the intersection, delay is increased, but the volume to capacity ratio does not increase to a significant level; therefore, this is not considered a significant impact. Grade separation, however, would eliminate any increase in delay.

3.5.3.5 Grade Separation at McLaughlin

An option is being considered that grade separates the light rail corridor over US 101 on a separate light rail structure north of the US 101/Capitol Expressway Interchange. The grade separation would need to be continued through the McLaughlin intersection because of design requirements. With at-grade operations of light rail through the McLaughlin intersection, delay is increased, particularly in the PM peak hour. With grade separation of light rail, no increase in delay would occur. The at-grade operations resulted in a significant impact in the AM peak hour for the full build project. Grade separation did not trigger a significant impact.

3.6 Transit Network

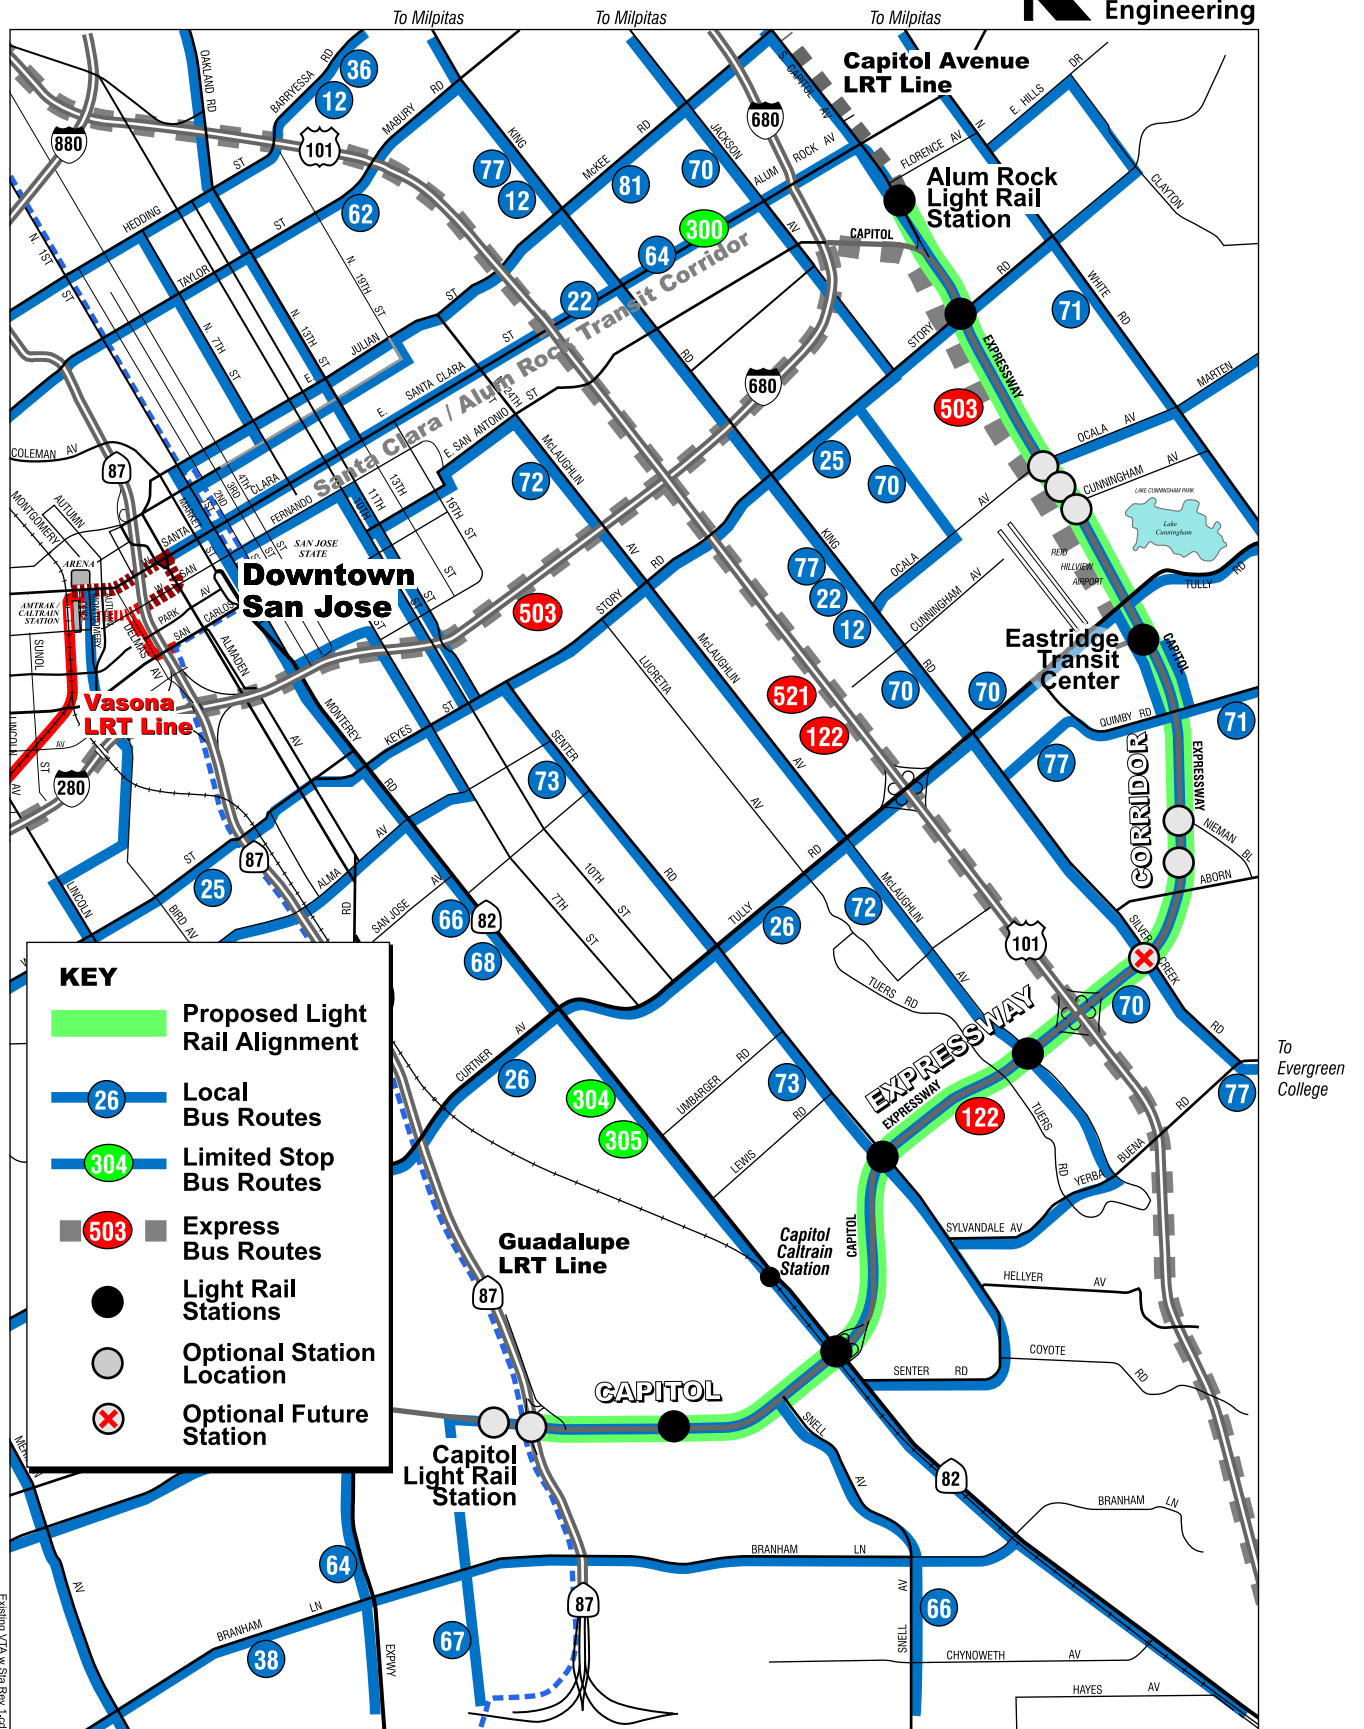

The more comprehensive and seamless a transit network is, the more success it is likely to achieve. Connections between different public transport modes and systems tend to attract more transit riders and bolster patronage for all connecting services. As such, the VTA emphasizes multi-modal public transport connections wherever those connections are feasible.

In the Capitol Expressway corridor, the future light rail line would connect with the East Valley bus services operated by the VTA. As well, Caltrain commuter rail service operated by the Joint Powers Board could connect with the light rail line through a new multi-modal facility at Monterey Highway.

3.6.1 VTA Public Transit

The connectivity of the transit network in the East Valley will depend upon strong linkages between the light rail line and the supporting bus services. Current bus service in the study area centers on Eastridge Transit Center for the terminus of most local and regional routes, with connections available here between most lines in the area. Figure 3-5 presents a map of the existing VTA bus network for the East Valley with the proposed light rail line and stations overlaid for reference.

Once light rail is constructed on Capitol Expressway, the VTA will have the opportunity to reorganize the structure of the area's bus lines to interface with the high level of transit service provided by the new fixed rail link. Specific future operating plans for bus lines will not be completed in the Conceptual Engineering phase of the Capitol Expressway light rail project. Instead, they will be finalized closer to the time that the light rail line will go into operational service.

July 2002
Rev 6/17/03

DOWNTOWN EAST VALLEY CAPITOL EIR

Figure 3-5

EXISTING TRANSIT NETWORK and PROPOSED LIGHT RAIL STATIONS

Certain possible route changes have been identified, however, in order to plan the size of transit facilities and complete the environmental studies. Specifically, the routes around Eastridge Transit Center and a proposed Monterey Transit Center have been reviewed to assess how many bus stalls could be needed at each of the facilities. Table 3-9 outlines potential actions that may be taken to reorganize the bus network.

Table 3-9 Potential Future Bus Integration Actions

| Line | Proposed Action | Potential Impacts |
|------|------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12 | Keep. | Meets LRT at Eastridge Station. Needs stop in Eastridge bus exchange. |
| 22 | Becomes BRT Line. | Meets LRT at Eastridge Station. Needs stop in Eastridge bus exchange. Articulated buses. |
| 25 | Keep. | Meets LRT at Story Station. |
| 26 | Keep. | Meets LRT at Eastridge Station. Needs stop in Eastridge bus exchange. |
| 30 | Revise circle route. | Meets LRT at Eastridge & Nieman Stations. Needs stop in Eastridge bus exchange. |
| 31 | Keep. | Meets LRT at Eastridge & Nieman Stations. Needs stop in Eastridge bus exchange. |
| 37 | Terminate at Monterey Station. | Meets LRT at Capitol, Vista Park & Monterey Stations. Needs stop in Monterey bus exchange. |
| 38 | Reroute along Snell. Terminate at Monterey Station. | Removes service from portion of Monterey Hwy. Meets LRT at Monterey Station. Needs stop in Monterey bus exchange. |
| 39 | Revise circle route. | Meets LRT at Eastridge & Ocala Stations. Needs stop in Eastridge bus exchange. |
| 64 | Part of Santa Clara/Alum Rock transit project. | Meets LRT at Alum Rock Station. |
| 66 | Reroute through Monterey Station & on Snell. | Removes service from portion of Monterey Hwy. Meets LRT at Monterey Station. Needs stop in Monterey bus exchange (not terminus). |
| 67 | Keep. | Meets LRT at Capitol Station. |
| 68 | Keep. | Meets LRT at Monterey Station. Connection to other buses at Monterey Station could be awkward from bus stops on Monterey Highway. |
| 70 | Remove detour to King Road. Run down Capitol Expwy. Terminate at Eastridge. | Meets LRT at Eastridge & Ocala Stations. Needs stop in Eastridge bus exchange. (Terminates at Eastridge only if LRT continues to Hwy 87.) |
| 71 | Reroute along Tully instead of Quimby. | Meets LRT at Eastridge Station. Needs stop in Eastridge bus exchange. Service on Quimby replaced by circle route(s). |
| 72 | Remove detour south of Capitol Expwy. Terminate at Monterey Station. Introduce new route for southern extension. | Meets LRT at McLaughlin, Senter & Monterey Stations. Needs stop in Monterey bus exchange. New route south of Monterey Station. New circulator route for neighborhood service. |

| Line | Proposed Action | Potential Impacts |
|-----------------|---------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 73 | Remove detour south of Capitol Expwy. Terminate at Monterey Station. | Meets LRT at Senter & Monterey Stations. Needs stop in Monterey bus exchange. New circulator route for neighborhood service. |
| 74 | Delete service. | Replaced by LRT service. |
| 77 | Remove detour to Eastridge. Keep on King Road. | Meets LRT at Silver Creek Station. Access to Eastridge would require transfer. |
| 122 | Keep. | Meets LRT at McLaughlin, Senter & Monterey Stations. Would stop on the street at Monterey Station. |
| 300 | Part of (Santa Clara/Alum Rock transit project. | Meets LRT at Alum Rock Station. |
| 304 & 305 | Replace with Monterey BRT. | Meets LRT at Monterey Station. Connection to buses at Monterey Station could be awkward. May access exchange (not terminus). Articulated buses. |
| 321 | Delete service. | Replaced by LRT service. |
| 345 | Delete service. | Replaced by LRT service. |
| 503 | Maintain. | Meets LRT at Story, Ocala & Eastridge Stations. Needs stop in Eastridge bus exchange. |
| New | Introduce new long-haul line south of Monterey Station. Replace southern extension of Line 72. | New route. Meets LRT at Monterey Station. Needs stop in Monterey bus exchange. |
| New | Introduce new local route around Monterey Station. Terminate at Monterey Station. | New route. Meets LRT at Capitol, Monterey, Senter & McLaughlin Station. Needs stop in Monterey bus exchange. |

Source: VTA and Korve Engineering, Inc., 2002

At Eastridge Transit Center, the majority of existing routes are assumed to still be operating when light rail service opens. However, the new light rail line will replace limited-stop services (Lines 321 and 345). With approximately nine bus lines using the facility (eight as a terminus), ten bus bays would be needed to provide a stall for each route, in each direction. Including two stalls for future expansion, the reconstructed bus loop should provide approximately 12 stalls for active buses in addition to layover areas for the eight terminating bus routes.

For the Monterey Transit Center, the current bus transfer location at Monterey Highway and Senter Road would be shifted to the proposed bus exchange. Six bus routes would then use the new facility, four as their termini. Including stalls for two new lines to serve local market areas and two stalls for future expansion, approximately 12 stalls would be required in the new facility. Layover space would be necessary for up to six vehicles.

In both transit centers, some stalls will be required to accommodate articulated buses, since the Line 22 Bus Rapid Transit (BRT) and the Monterey BRT may provide service to the exchanges. These stalls are included in the total stall estimates for each facility. Table 3-10 summarizes the requirements of the proposed Eastridge and Monterey Transit Centers with the construction of light rail in the corridor. The existing transit center at Eastridge would be expanded and a new transit center would be constructed at Monterey Highway serving both light rail and the relocated Caltrain Station.

Table 3-10 Proposed Transit Center Requirements

| | Eastridge | Monterey |
|----------------------------------------------|-----------|--------------------------|
| Existing lines | 14 | 8 |
| Existing bus stalls * | 10 | No off-street facilities |
| Proposed Bus Stalls with light rail** | | |
| For projected service | 10 | 10 |
| For light rail expansion | 2 | 2 |
| Layover spaces required *** | 8 | 6 |
| Total | 20 | 18 |

Source: VTA and Korve Engineering, Inc., 2002

* Not all bus stalls are currently in use.

** Bus stall requirements include two stalls for each through route (one for each direction) and one stall for each terminating route. They do not include any shared bus stops which could reduce the number of total stalls needed.

*** Layover spaces have been estimated based on one space for each terminating route.

3.6.2 Caltrain Service

Caltrain commuter rail service links Gilroy and San Francisco via San Jose, Palo Alto, and Redwood City. In the East Valley study area, Caltrain runs parallel to Monterey Highway. The closest Caltrain station to the Capitol Expressway corridor is located approximately 2,000 feet north at the intersection of Monterey Highway and Fehren Avenue.

Both light rail and Caltrain passengers could benefit from making the connection easier between the Monterey Light Rail Station and the Caltrain Capitol Station. To do so, the VTA and the Joint Powers Board may consider a cooperative effort to relocate the Caltrain station to include it, and its park-and-ride lot, in a new Monterey Transit Center.

An initial conceptual plan has the light rail station located on the Capitol Expressway overcrossing with vertical transfers available at each end. On the east end, the connection would link to the east side of Monterey Highway, where pedestrians and Monterey BRT passengers could access the light rail system. The vertical connection on the west end of the station platform would connect to a relocated Caltrain station platform along the western edge of the train tracks. A park-and-ride lot and bus exchange would be constructed nearby to satisfy light rail and Caltrain demands; multiple sites are being considered for the park-and-ride lot and bus exchange (see *Park & Ride Facilities*).

3.7 Park & Ride Facilities

Park-and-ride facilities will be available for use by Capitol Expressway light rail passengers. Three of the future light rail stations along the Capitol Expressway LRT Line already have park-and-ride facilities constructed next to them: Alum Rock Station, Eastridge Transit Center Station, and Capitol Station. Two additional new park-and-ride lots may be constructed to serve the Ocala Station and Monterey Station. For those lots at Alum Rock and Capitol Stations, no modifications to their geometry are anticipated. The facility at Eastridge Station would be redesigned and expanded to satisfy future demand when the light rail station is constructed. Table 3-11 provides information about the areas around the five park-and-ride lots.

A range of park-and-ride demand is noted in Table 3-11 which is based on projected demand from 2010 to 2025. The modeling process used to estimate park-and-ride demand tends to over estimate the number of people arriving at a light rail station and parking their car for the day. Historically, VTA has found more individuals arrive by walking, being dropped off or transferring from a bus than estimated by the model, resulting in an overestimation of the park-and-ride demand. The park-and-ride demand projection included both parking spaces that will be occupied by a vehicle during the majority of the day, and also for kiss-and-ride drop-offs. Approximately five percent of the park-and-ride spaces will be designed and signed for kiss-and-ride.

Table 3-11 Proposed Park-and-Ride Sites and Estimated Demand and Capacity for the Light Rail Alternative

| Proposed Station | Notes | Estimated Peak Park-and-Ride | |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|------------------|
| | | Demand | Capacity |
| Alum Rock-Existing | The existing park-and-ride lot could support the Light Rail Alternative. No change in capacity (currently 105) is proposed. The total demand also includes park-and-ride spaces required to serve the Capitol Light Rail Line. | 60 to 90 | 105 ¹ |
| Ocala Avenue/Eastridge Transit Center Area | The Ocala Avenue Station and Eastridge Transit Center essential function as one area to serve park-and-ride needs. A new park-and-ride lot on the southwest corner of Ocala Avenue/Capitol Expressway could provide approximately 100 parking stalls. However, if there is no park-and-ride at Ocala Avenue this demand would shift to the Eastridge location and there would be a greater expansion of spaces at the Eastridge Transit Center. The Eastridge Transit Center park-and-ride could be expanded beyond its current capacity of 133 parking stalls to meet the peak demand of 550 parking spaces. | 250 to 550 | 250 to 550 |
| Monterey Highway-Options | One or a combination of the three options under considerations for the Light Rail Alternative can accommodate up to 300 parking stalls. Multi-modal connections with the relocated Caltrain Station and new bus transit center will be provided. The total demand includes 100 parking stalls for the relocated Caltrain Station. | 260 to 300 | 260 to 300 |
| SR 87 (Capitol)-Existing | Existing facility has over 900 stalls (including both north and south park-and-ride lots). Estimated demand can be accommodated without expansion. The total demand also includes park-and-ride spaces required to serve the Guadalupe Light Rail Line. | 310 to 375 | 914 ¹ |

¹ Existing park-and-ride spaces
Source: Korve Engineering 2003

Park-and-ride demand is noted jointly for the Ocala Avenue and Eastridge Transit Center Stations. The maximum peak demand for the Eastridge Transit Center park-and-ride would be in 2025 under the scenario where light rail is constructed only to Eastridge Transit Center and no park-and-ride facilities are provided at Ocala Avenue. The demand could be 250 to 550 vehicles. Approximately 265 park-and-ride spaces are proposed to be incorporated into the project through the addition of parking on existing VTA property and expansion of park-and-ride spaces onto Eastridge property. Because of the extensive bus access to the Eastridge transit

center, the full demand for park-and-ride may not be realized, or not realized in the time periods indicated by the travel demand model. VTA will monitor park-and-ride demand at Eastridge and expand parking past the 265-space level if demand warrants.

At the Monterey Station, the demand is estimated to be between 260-300 stalls. (Both of these figures include 100 stalls for the demand associated with service at a relocated Caltrain station.) The capacities of the three sites under consideration for the park-and-ride lot range from 260 to 500 stalls. Because the transportation model tends to overestimate park-and-ride demand and historically VTA has experienced fewer people parking at the park-and-ride than was projected, there would be sufficient capacity to accommodate the demand at any of the three sites considered for the Monterey Station park-and-ride lot. The park-and-ride lots at Alum Rock Station and Capitol Station are expected to have capacity enough to handle the estimated peak park-and-ride demand.

3.8 Pedestrians & Bicycles

The streetscape concept is designed to transform the Capitol Expressway from a single purpose limited access expressway to a multi-modal parkway boulevard. It will be designed as a pedestrian and bicycle-friendly 'green' street featuring a continuous multi-use path along the east/south side of the roadway to the Nieman Boulevard intersection. The frontage roads will be incorporated as an integral part of the overall right-of-way design to improve pedestrian and bicyclist transitions from existing residential neighborhoods to the boulevard.

The multi-use path will be a ribbon of greenway approximately 22 feet wide with a 10-foot pathway dedicated to pedestrians and bicyclists. It will link with other greenways in the East Valley study area. In particular, strong connections with Lake Cunningham Park and the Coyote Creek Park Chain trail could be accommodated by the light rail project design. The trail could interface with cross-street sidewalks and bicycle facilities (where applicable) to permit penetration into residential neighborhoods and to support pedestrian and cyclist activity to and from the light rail stations.

The light rail project will maintain existing pedestrian intersection crossings. Where pedestrian crossings are permitted under existing conditions, those crossings would be possible in the future, although some crossings may be extended by a wider expressway cross-section. At all intersections along the at-grade portions of the light rail line, pedestrians crossing Capitol Expressway will walk across rail tracks. These crossings will have gates, fences, and/or signals as deemed necessary under the California Public Utilities Commission General Orders.

Additionally, pedestrian overcrossings have been included in, or are options for, the design of stations at Story Road, Senter Road, Silver Creek Road, and McLaughlin Road. These overcrossings would serve not only light rail passengers but also pedestrians seeking to avoid crossing the expressway at grade.

3.9 Goods Movement

The project will not impact the movement of goods along the corridor. For a portion of the corridor the HOV lanes are being removed. However, the HOV lane is generally not used for the movement of goods. There is no change in access proposed for the corridor. All vehicle movements than can occur today will be allowed with construction of the project.

3.10 Parking

The construction of the Capitol Expressway Light Rail Project will not change the parking conditions on Capitol Expressway. Currently, no parking is permitted on the expressway, and future conditions will not include parking on the facility. However, Capitol Avenue parking will be removed on both sides of the street from Wilbur Avenue to Capitol Expressway to enable construction of the light rail.

The Project does, however, reconfigure the frontage roads on the west side of Capitol Expressway from Excalibur to north of Story Road and on the east side from Mervyns Way to just north of Ocala Avenue. With the Project, the frontage roads will be narrowed and parking will only be allowed on one side. The parking is proposed to be provided on the outside (expressway side) to maximize the number of spaces. Parking on the inside (non-expressway side) is not as efficient because of the numerous driveway curb cuts.

Table 3-12 indicates the amount of existing parking use by segment along the frontage roads. The parking use is observed through field investigations at 4:30 AM. The land uses along the frontage roads are residential and the demand at 4:30 AM represents the maximum demand.

Also noted on Table 3-12 is the parking supply by segment. The parking supply assumes that parking is restricted to the outside of the frontage road. At one location, between Kollmar Drive and Sussex Drive, on the east side of Capitol Expressway, a total of 15 parked vehicles were observed. The Project will eliminate all parking in this segment and these vehicles will be displaced to adjacent streets where sufficient excess parking exists.

Table 3-12 Frontage Road Parking

| Location | Current Use | Proposed Supply |
|-----------------------------------------------------------------------|-------------|-----------------|
| Westside of Capitol Expressway between Excalibur and Story | 31 | 43 |
| Eastside of Capitol Expressway between Mervyns Way and Story | 1 | 27 |
| Eastside of Capitol Expressway between Kollmar Drive and Sussex Drive | 15 | 0 |
| Eastside of Capitol Expressway between Sussex Drive and Bristol | 7 | 30 |
| Eastside of Capitol Expressway between Bristol and Coventry | 5 | 23 |
| Eastside of Capitol between Coventry and Woodmoor | 6 | 26 |
| Eastside of Capitol between Woodmoor and North of Ocala | 16 | 30 |

3.11 Community Access

The Capitol Expressway Light Rail Project will not impede any access that is currently offered from the expressway. All intersection movements that are possible before construction will be

possible after the project is implemented. And since light rail will operate in the median of the expressway, no right turn in/out access to commercial developments will be removed. Thus, all community features in the study area will have their access maintained.

The project will, however, disrupt access along Capitol Avenue. Between Wilbur Avenue and Capitol Expressway, Westboro Drive (east of Capitol Avenue) and Lombard Avenue (west of Capitol Avenue) will be converted to right in/out only due to the construction of the light rail. Westboro Drive has alternative access from within the neighborhood that motorists on southbound Capitol Avenue can access from Wilbur Avenue. Lombard Avenue, on the other hand, does not have alternative access. Northbound motorists on Capitol Avenue will require a U-turn at Wilbur Avenue to backtrack to Lombard Avenue. Another minor change in local circulation occurs near the intersection of Capitol Expressway and Story Road. In the southeast quadrant of Capitol Expressway and Story Road, Kollmar Drive will be cul-de-saced. Vehicles continuing to use Kollmar Drive will need to circulate back to Story Road. Traffic on Capitol Avenue that currently uses Kollmar Drive will use Sussex Drive to McGinness Avenue.

The project will also lengthen some pedestrian crosswalks, and most pedestrians that cross the expressway will walk across rail tracks. These conditions should affect only those pedestrians using the community features that are within walking distance of the expressway and light rail stations.

3.12 Intersection Queuing

Left turn queuing was calculated at the major intersections along Capitol Expressway for the future conditions. Table 3-13 summarizes the projected queues for 2010 and Table 3-14 summarizes the projected queues for 2025. The left turn bays that were found to exceed capacity in the existing scenario also exceed capacity in the future design years.

Intersections where the left turn bays are projected to exceed the storage capacity were compared to those intersections that are projected to have a significant impact for the Light Rail Alternative. The only intersection that is projected to be significantly impacted by the Light Rail Alternative that also is projected to have an overflow of the left turn storage bays on Capitol Expressway is the southbound left turn at Tully Road. At Tully Road, light rail will be grade separated and the overflow of the left turn bay is not associated with the Proposed Project.

3.13 Safety & Security

3.13.1 Safety

Passenger safety will be protected at each station by railings along the platform and fencing the alignment adjacent to the station, providing crosswalks or grade-separated pedestrian overcrossings to the station from the surrounding roadways, and by providing adequate pedestrian waiting areas at crossings. The light rail project will meet or exceed CPUC requirements for safety. At applicable locations, walkways will be designated within station areas to connect the light rail platform to the parking areas, bus stops and platforms, and automobile passenger pick-up and drop-off areas.

¹ Both EB & WB are shared left through lanes with approach phasing

² SB left is exclusive and shared left through lane with approach phasing

³ EB left contains two 250 ft lanes and 400 ft of single lane for storage, average of 325 ft per lane has been used

⁴ Both NB & SB are shared left through lanes with approach phasing

Required storage per vehicle 25 feet.

Pedestrian crosswalks along Capitol Expressway will be designed to provide suitable places of refuge for pedestrians where they cross the light rail trackway. Pedestrian signal activation push buttons will be included at all intersections and added to the medians at station platforms.

Along the expressway there are periodic pullouts for disabled vehicles. The Light Rail Alternative will provide vehicle refuge areas with the project.

3.13.2 Security

Station platforms will be designed and located to be visible from the adjacent roadways. All platforms and park-and-ride lots will be lighted in the evening and night-time hours to enhance security. VTA security will patrol all facilities on a regular basis to maintain passenger security.

3.14 Construction Effects

Construction of light rail transit on Capitol Expressway would take place over several years. At the height of construction, a number of construction employees and equipment would occupy portions of the street including the median at active construction locations. In the most active areas, construction would periodically reduce Capitol Expressway from six lanes to four lanes, two in each direction at various times during non peak hours. As a result, construction activity on Capitol Expressway would impact traffic and the LOS at intersections and the capability of transit service to adhere to the published schedules.

The construction schedule, mitigations of construction impacts and public outreach on the two segments would be coordinated by VTA throughout the process.

3.14.1 Construction Effects on Traffic

The construction of light rail line would be a continuous, year-round process with construction taking place at two to three mile segments at a time. However, the peak of daily construction activity in any one area would take place during the off-peak commute hours when the LOS on Capitol Expressway at most major intersections is at C or better. Reducing the effects of the Project construction on traffic would be achieved by means of four coordinated resources:

- VTA in concert with the County of Santa Clara and City of San Jose, would prepare a construction mitigation Traffic Management Plan that would be a part of the construction contract for the proposed Project.
- Based on the Traffic Management Plan, contractors would use flagmen and follow a daily construction schedule that would restore traffic capacity during peak periods on weekdays (the morning commute period is 7:00 to 9:00 AM and the evening commute period is 4:00 to 6:00 PM).
- VTA would oversee construction to assure all mitigation measures are met. VTA would establish a field office along the Project that would be open to the public during specific hours of the week.

Construction equipment traffic from the contractors would be controlled by flagman and the procedures contained in the Traffic Management Plan. For example, the use of the median to store large pieces of equipment overnight would be regulated. Traffic that may attempt to use neighborhood streets to avoid construction areas would be controlled by two characteristics of the roadway network adjacent to Capitol Expressway:

- First, while there are no efficient, directly parallel detours around Capitol Expressway, some arterials are capable of handling traffic diverted from Capitol Expressway. White Road, King Road, Tully Road, and Branham Lane will likely handle most of the diverted traffic. Portable electronic variable message signs and other signage would be positioned at approaches to Capitol Expressway north and south of individual construction zones to warn motorists of construction ahead and direct traffic to use alternative routes where feasible. Flagmen would be at all major construction points to assist in the control of traffic and support the use of these roads as a detour.
- Second, there are very few paths of travel through neighborhood streets that offer parallel routes to Capitol Expressway. Therefore, neighborhood streets would be protected from being used as cut-through streets by motorists.

3.14.2 Construction Effects on Transit

Transit service on time performance can be expected to drop slightly during the construction period. Since the construction period will be limited in duration, no specific mitigation measures are proposed.

3.14.3 Construction Effects on Pedestrians

In areas along Capitol Expressway where new sidewalks are being added or replacing substandard sidewalks, the construction will require alternative paths. At any one time, one side of Capitol Expressway would always have a travel path for pedestrians. Signs would be posted to direct pedestrians to cross at intersections in order to proceed along Capitol Expressway and avoid the construction area.

3.14.4 Construction Effects on Bicycles

Currently, bicyclists are able to use the shoulders of the expressway as a bicycle lane. During construction of the light rail project, the shoulders should be maintained or the outside lanes of the expressway should be expanded to allow bicyclists, as feasible, to continue to travel the corridor during construction.

4.0 PROJECT MITIGATION

4.1 Traffic Mitigation

The traffic mitigation discusses the improvements to the roadway network necessary to alleviate any significant impacts caused by the light rail extension to the roadways and intersections along the corridor. The impacts and mitigation are separated into the two study years, 2010 and 2025. The No Build and the Baseline Alternatives assume that the HOV lanes remain and the Light Rail Alternatives assume that the HOV lanes are removed to provide sufficient width for the light rail trackway. The HOV lanes were constructed temporary improvements until light rail could be constructed in the corridor. The Evergreen Specific Plan EIR prepared in 1993 stated:

“...traffic mitigation improvements proposed as part of the Evergreen Specific Plan include adding additional lanes to a portion of Capitol Expressway that would use the median section of the right-of-way where a light rail line would be located. These lanes would be replaced by the light rail transit if the Capitol Corridor is implemented.” Below, it may not be desirable to actually construct these improvements. The City of San Jose’s desired minimum overall performance for City streets during peak periods is level of service D. A proposed amendment to the City’s 2020 General Plan states:

“Development projects should be required to provide appropriate mitigation measures if they have the potential to reduce the level of service to E or worse. These mitigation measures can include a combination of street improvements and/or improvements to transit, bicycle, or pedestrian facilities when the mitigation for vehicular traffic compromises community livability... [or] would result in an unacceptable impact on an affected neighborhood or City street.”

Mitigation measures are described below. The significant investment in improved transit service by VTA in this corridor will provide multi-modal benefits for the region. The decrease in traffic level of service at some intersections should be viewed as an opportunity to divert more people from their automobiles to transit. Additionally, the project is improving bicycle and pedestrian travel along the corridor which will also improve local and regional mobility.

4.1.1 Baseline Year 2010

Two intersections would result in adverse traffic impacts in the AM peak hour with the Baseline Alternative. These intersections are discussed below:

4.1.1.1 **Capitol Expressway/Story Road**

The Capitol Expressway/Story Road intersection is projected to operate at level of service F. Under the Baseline Alternative in 2010, the delay value and V/C ratio for the intersection for the AM peak hour would exceed the thresholds for an intersection that already operates at level of service F, resulting in an adverse effect. Implementation of the following mitigation measure would minimize the adverse effect.

Mitigation: Addition of a Third Southbound Left Turn Lane to Capitol Expressway at Story Road. Potential mitigation measure under the Baseline Alternative would be to

add a third southbound left turn lane on the expressway to eastbound Story Road. This would involve re-striping to allow both through and left-turn movements to occur from an existing lane.

4.1.1.2 Capitol Expressway/Senter Road

The Capitol Expressway/Senter Road intersection is projected to operate at level of service F. Under the Baseline Alternative in 2010, the delay value and V/C ratio for the intersection for the AM peak hour would exceed the thresholds for an intersection that already operates at level of service F, resulting in an adverse effect. Implementation of the following mitigation measure would minimize the adverse effect.

Mitigation: Addition of Left-Turn and Through Lanes on Senter Road. Potential mitigation under the Baseline Alternative includes adding a second northbound and southbound left-turn lane and a second southbound through lane on Senter Road. The southbound through lane would be separate of an exclusive right-turn lane. This is a programmed transportation improvement, and no additional mitigation is required or proposed under the Baseline Alternative.

4.1.2 Baseline Year 2025

Three intersections would result in adverse traffic impacts in the AM peak hour under the Baseline Alternative. These intersections are discussed below:

4.1.2.1 Capitol Expressway/Ocala Avenue Intersection

The Capitol Expressway/Ocala Avenue intersection is projected to operate at level of service D. Under the Baseline Alternative in 2025, the level of service for the intersection for the AM peak hour would decline to level of service E, resulting in an adverse effect. Implementation of the following mitigation measure, would minimize the adverse effect.

Mitigation: Signal Modifications to the Capitol Expressway/Ocala Avenue Intersection. A potential mitigation measure for the Baseline Alternative would be to provide an overlap phase for the westbound right turn with the southbound left turn, prohibiting U-turns for the southbound left turn (This involves a signal modification).

4.1.2.2 Capitol Expressway/Aborn Road Intersection

The Capitol Expressway/Aborn Road intersection is projected to operate at level of service F. Under the Baseline Alternative in 2025, the delay value and V/C ratio for the intersection for the AM peak hour would exceed the thresholds for an intersection that already operates at level of service F, resulting in an adverse effect. Implementation of the following mitigation measure, would minimize the adverse effect.

Mitigation: Addition of Left-Turn Lanes from Aborn Road to Capitol Expressway. Mitigation for this effect would be to add a third left-turn lane from northbound Aborn Road to westbound Capitol Expressway. This mitigation measure is included in the

Comprehensive County Expressway Planning Study. It does not require additional right-of-way and this mitigation measure would be implemented by the project.

4.1.2.3 Capitol Expressway/Senter Road Intersection

The Capitol Expressway/Senter Road intersection is projected to operate at level of service F. Under the Baseline Alternative in 2025, the delay value and V/C ratio for the intersection for the AM peak hour would exceed the thresholds for an intersection that already operates at level of service F, resulting in an adverse effect. Implementation of the following mitigation measure, would minimize the adverse effect.

Mitigation: Addition of Left- and Right-Turn Lanes from Senter Road to Capitol Expressway. Potential mitigation under the Baseline Alternative includes adding a second northbound and southbound left turn lane and a southbound through lane separate from an exclusive right turn lane. These are programmed improvements that will be implemented by the City of San Jose and will reduce the impact to a level less than significant; therefore, no further mitigation is required.

4.1.3 Light Rail Alternative 2010

Six intersections would result in adverse traffic impacts in the AM and/or PM peak hour with the Light Rail Alternative. These intersections are discussed below.

4.1.3.1 Capitol Expressway/Story Road Intersection

The Capitol Expressway/Story Road intersection is projected to operate at level of service F. Under the Light Rail Alternative MOS and Phase 2 in 2010, the delay value and V/C ratio for the intersection for the AM and PM peak hours would exceed the thresholds for an intersection that already operates at level of service F, resulting in an adverse effect. Mitigation measures have been identified that would minimize the adverse effects on traffic, however, in implementing these mitigation measures, further adverse traffic and construction-related traffic impacts would occur.

A potential mitigation measure would be to replace the HOV lanes removed as part of the project. Because the HOV lanes would be removed to provide space for the light rail trackway, right-of-way is not available for this mitigation and would need to be acquired from adjacent property. All four quadrants of the intersection would require right-of-way acquisitions that would result in displacements of commercial properties.

Another potential mitigation measure would grade separate the traffic movements with Capitol Expressway depressed and traveling under Story Road. To implement this mitigation, three to four residential properties on the northwest side and seven to ten residences on the southwest side would be displaced. The frontage roads on the northeast and southeast sides of the intersection would also be required to provide sufficient right-of-way, further impacting business and residential access.

Because the implementation of these mitigation measures would result in adverse traffic and construction-related traffic impacts for which no mitigation is feasible, these would be considered substantially adverse effects for which there is no feasible mitigation.

Mitigation: There is no feasible mitigation for these effects.

4.1.3.2 Capitol Expressway/Ocala Avenue Intersection

The Capitol Expressway/Ocala Avenue intersection is projected to operate at level of service D. Under the Light Rail Alternative MOS and Phase 2 in 2010, the level of service for the intersection would decline to level of service E in the PM peak hour, resulting in an adverse effect. A mitigation measure has been identified that would minimize the adverse effects on traffic, however, in implementing these mitigation measures, further adverse traffic and construction related traffic impacts would occur.

A potential mitigation measure would be to replace the HOV lanes removed as part of the project. Because the HOV lanes would be removed to provide space for the light rail trackway, right-of-way is not available for this mitigation and would need to be acquired from adjacent property. All four quadrants of the intersection would require right-of-way acquisitions that would result in displacements of commercial properties.

Because the implementation of these mitigation measures would result in adverse traffic and construction-related traffic impacts for which no mitigation is feasible, these would be considered substantially adverse effects for which there is no feasible mitigation.

Mitigation: There is no feasible mitigation for these effects.

4.1.3.3 Capitol Expressway/Tully Road Intersection

The Capitol Expressway/Tully Road intersection is projected to operate at level of service D in the AM peak hour and at level of service F in the PM peak hour. Under the Light Rail Alternative MOS and Phase 2 in 2010, the level of service for the intersection would decline to level of service E in the AM peak hour, and in the PM peak hour, the delay value and V/C ratio for the intersection would exceed thresholds for an intersection that already operates at level of service F, resulting in an adverse effect. Implementation of the following mitigation measure would minimize the adverse effects.

Mitigation: Maintain HOV Lane on Capitol Expressway as an HOV Bypass Lane.

Because light rail would be located on the westside of Capitol Expressway through the Tully Road intersection, sufficient width would be available to maintain the fourth through lane on Capitol Expressway. This lane will need to be dropped north of Tully Road under the MOS and south of Tully Road under Phase 2. However, through the intersection it would service as an HOV bypass lane.

4.1.3.4 Capitol Expressway/Aborn Road Intersection

The Capitol Expressway/Aborn Road intersection is projected to operate at level of service F in the AM peak hour and at level of service E in the PM peak hour. Under the Light Rail

Alternative Phase 2 in 2010, the delay value and V/C ratio for the intersection the AM peak hour would exceed the thresholds for an intersection that already operates at level of service F, resulting in an adverse effect. During the PM peak hour, the delay value and V/C ratio for the intersection in the AM peak hour would exceed the thresholds for an intersection that already operates at level of service F, resulting in an adverse effect. Implementation of one of the following mitigation measure would minimize these adverse effects.

Mitigation: Replace the HOV Lanes South of Tully Road. A potential mitigation measure would be to replace the HOV lanes removed as part of the project from Tully Road to U.S. 101. Under the Light Rail Alternative, the HOV lanes would be removed. Right-of-way would not be available for this mitigation and would need to be acquired from adjacent property. The implementation of the mitigation measure would result in other significant and unavoidable impacts related to these acquisitions.

Mitigation: Addition of a Third Left-Turn Lane to Aborn Road at Capitol Expressway. Another potential mitigation measure would be a third left turn lane from northbound Aborn Road to westbound Capitol Expressway does not require additional right-of-way). This mitigation measure was proposed in the *Comprehensive County Expressway Planning Study*, but would be included as mitigation for the Light Rail Alternative since no additional right-of-way is required.

4.1.3.5 Capitol Expressway/Silver Creek Road Intersection

The Capitol Expressway/Silver Creek Road Intersection is projected to operate at level of service F. Under the Light Rail Alternative MOS in 2010, the delay value and V/C ratio for the intersection in the AM and PM peak hours would exceed the thresholds for an intersection already operating at level of service F, resulting in an adverse effect. Implementation of the following mitigation measure would minimize the adverse effect.

Mitigation: Replace the Lanes South of Tully Road. A potential mitigation measure would be to replace the HOV lanes removed as part of the project from Tully Road to U.S. 101. Under the Light Rail Alternative, the HOV lanes would be removed. Right-of-way would not be available for this mitigation and would need to be acquired from adjacent property. The implementation of the mitigation measure would result in other significant and unavoidable impacts related to these acquisitions.

Mitigation: Construct Interchange at Silver Creek Road. Another potential mitigation measure is an interchange for traffic movements between Silver Creek Road and Capitol Expressway. This mitigation was proposed in the *County's Capitol Expressway Planning Study*. An interchange for traffic movements would need to be planned and designed in conjunction with grade separation of the light rail trackway.

4.1.3.6 Capitol Expressway/McLaughlin Avenue Intersection

The Capitol Expressway/McLaughlin Avenue Road intersection is projected to operate at level of service E. Under the Light Rail Alternative MOS in 2010, the level of service for the

intersection for the AM peak hour would decline to level of service F, resulting in an adverse effect. Implementation of the following mitigation measure would minimize the adverse effect.

Mitigation: Change Intersection Approaches at McLaughlin Avenue. The City of San Jose will be providing a programmed improvement to change the McLaughlin Avenue Approaches to remove the split phasing to provide two left turn lanes, two through lanes, and a right-turn lane on both approaches to McLaughlin Avenue. This improvement would mitigate the effect, and no further mitigation is required. The *Comprehensive County Expressway Planning Study*, which is currently underway, further recommends a third southbound left-turn lane from McLaughlin Avenue to Capitol Expressway. This addition of these lane, while improving the intersection operation, is not necessary to mitigate the adverse effect of the Light Rail Alternative.

4.1.4 Light Rail Alternative 2025

Traffic Impacts would result at eight intersections with the Light Rail Alternative in 2025.

4.1.4.1 Capitol Expressway/Capitol Avenue Intersection

The Capitol Expressway/Capitol Avenue intersection is projected to operate at level of service F. Under the Light Rail Alternative MOS and Phase 2 in 2025, the delay value and V/C ratio for the intersection for the PM peak hour would exceed the thresholds for an intersection that already operates at level of service F, resulting in an adverse effect. Implementation of the following mitigation measure would minimize the adverse effect.

Mitigation: Addition of Shared Left-Turn and Through Lane on Capitol Avenue at Capitol Expressway. Potential mitigation under the Light Rail Alternative would be to add a third left turn lane shared with the through from Capitol Avenue onto southbound Capitol Expressway. This improvement is consistent with the recommendation of the *Comprehensive County Expressway Planning Study* and would reduce the impact to a level less than significant. This improvement can be made with traffic signing and pavement marking changes and does not require additional right-of-way.

4.1.4.2 Capitol Expressway/Story Road Intersection

The Capitol Expressway/Story Road intersection is projected to operate at level of service F. Under the Light Rail Alternative MOS and Phase 2 in 2025, the delay value and V/C ratio for the intersection for the PM peak hour would exceed the thresholds for an intersection that already operates at level of service F, resulting in an adverse effect. Mitigation measures have been identified that would minimize the adverse effects on traffic and construction-related traffic impacts would occur.

A potential mitigation measure would be to replace the HOV lanes removed as part of the project. Because the HOV lanes would be removed to provide space for the light rail trackway, right-of-way is not available for this mitigation and would need to be acquired from adjacent property. All four quadrants of the intersection would require right-of-way acquisitions that would result in displacements of commercial properties.

Another potential mitigation measure would grade separate the traffic movements with Capitol Expressway depressed and traveling under Story Road. To implement this mitigation, three to four residential properties on the northwest side and seven to ten residences on the southwest side would be displaced. The frontage roads on the northeast and southeast sides of the intersection would also be required to provide sufficient right-of-way, further impacting business and residential access.

Because the implementation of these mitigation measures would result in adverse traffic and construction-related traffic impacts for which no mitigation is feasible, these would be considered substantially adverse effects for which there is no feasible mitigation.

Mitigation: There is no feasible mitigation for these effects.

4.1.4.3 Capitol Expressway/Ocala Avenue Intersection

The Capitol Expressway/Ocala Avenue intersection is projected to operate at level of service D. Under the Light Rail Alternative MOS and Phase 2 in 2025, the level of service for the intersection in the AM peak hour would decline to level of service E, resulting in an adverse effect. During the PM peak hour, the delay value and V/C ratio for the intersection in the PM peak hour would exceed the thresholds for an intersection that already operates at level of service E, resulting in an adverse effect. A mitigation measure has been identified that would minimize the adverse effect on traffic, however, in implementing the mitigation measure, further adverse traffic and construction-related traffic impacts would occur.

The potential mitigation measure would be to replace the HOV lanes removed as part of the project. Because the HOV lanes would be removed to provide space for the light rail trackway, right-of-way is not available for this mitigation and would need to be acquired from adjacent property. All four quadrants of the intersection would require right-of-way acquisitions that would result in displacements of commercial properties.

Because the implementation of the mitigation measure would result in adverse traffic and construction-related traffic impacts for which no mitigation is feasible, these would be considered substantially adverse effect for which there is no feasible mitigation.

Mitigation: There is no feasible mitigation for these effects.

4.1.4.4 Capitol Expressway/Tully Road Intersection

The Capitol Expressway/Tully Road intersection is projected to operate at level of service E. Under the Light Rail Alternative MOS and Phase 2 in 2025, the level of service for the intersection in the AM peak hour would decline to level of service F, resulting in an adverse effect. During the PM peak hour, the delay value and V/C ratio for the intersection in the PM peak hour would exceed the thresholds for an intersection that already operates at level of service E, resulting in an adverse effect. Implementation of the following mitigation measure would minimize these adverse effects.

Mitigation: Maintain HOV Lane on Capitol Expressway as an HOV Bypass Lane.

Because light rail would be located on the westside of Capitol Expressway through the Tully Road intersection, sufficient width would be available to maintain the fourth through

lane on Capitol Expressway. This lane will need to be dropped north of Tully Road under the MOS and south of Tully Road under Phase 2. However, through the intersection it would service as an HOV bypass lane.

4.1.4.5 Capitol Expressway/Quimby Road Intersection

The Capitol Expressway and Quimby Road intersection is projected to operate at level of service E in the AM peak hour and level of service F during the PM peak hour. Under the Light Rail Alternative Phase 2 in 2025, the level of service for the intersection in the AM peak hour would decline to level of service F, resulting in an adverse effect. During the PM peak hour, the delay value and V/C ratio for the intersection in the PM peak hour would exceed the thresholds for an intersection that already operates at level of service F, resulting in an adverse effect. Implementation of the following mitigation measure would minimize these adverse effects.

Mitigation: Maintain the HOV Lanes on Capitol Expressway as an HOV Bypass Lane. With light rail located on the westside of Capitol Expressway through the Quimby Road intersection, sufficient width would be available to maintain the fourth through lane on Capitol Expressway. Through the intersection it would serve as an HOV bypass lane.

With light rail entering the median south of Eastridge, sufficient right-of-way would not be available to replace the HOV lanes and right of way would need to be acquired from adjacent property. The implementation of this mitigation measure would result in other significant and unavoidable impacts related to these acquisitions.

4.1.4.6 Capitol Expressway/Aborn Road Intersection

The Capitol Expressway/Aborn Road intersection is projected to operate at level of service F. Under the Light Rail Alternative Phase 2 in 2025, the delay value and V/C ratio for the intersection for the AM and PM peak hour would exceed the thresholds for an intersection that already operates at level of service F, resulting in an adverse effect. Implementation of one of the following mitigation measures would minimize the adverse effects.

Mitigation: Addition of Third Left-Turn Lane on Aborn Road at Capitol Expressway. A potential mitigation measure for the Light Rail to SR 87 would also be the addition of a third left turn lane on northbound Aborn Road to westbound Capitol Expressway (does not require additional right-of-way) that is part of the, *Capitol Expressway Planning Study*.

4.1.4.7 Capitol Expressway/Silver Creek Road Intersection

The Capitol Expressway/Silver Creek Road intersection is projected to operate at level of service F. Under the Light Rail Alternative Phase 2 in 2025, the delay value and V/C ratio for the intersection for the AM and PM peak hour would exceed the thresholds for an intersection that already operates at level of service F, resulting in an adverse effect. Implementation of one of the following mitigation measures would minimize the adverse effects.

Mitigation: Replace the HOV Lanes South of Tully Road. A potential mitigation measure would be to replace the HOV lanes removed as part of the project from Tully Road to U.S. 101. Under the Light Rail Alternative, the HOV lanes would be removed. Right-of-way would not be available for this mitigation and would need to be acquired from adjacent property. The implementation of the mitigation measure would result in other significant and unavoidable impacts related to these acquisitions.

Mitigation: Construct Interchange at Silver Creek Road. Another potential mitigation measure is an interchange for traffic movements between Silver Creek Road and Capitol Expressway. This mitigation was proposed in the *County's Capitol Expressway Planning Study*. An interchange for traffic movements would need to be planned and designed in conjunction with grade separation of the light rail trackway.

4.1.4.8 Capitol Expressway/McLaughlin Avenue Intersection

The Capitol Expressway/McLaughlin Avenue intersection is projected to operate at level of service D. Under the Light Rail Alternative 2025, the level of service for the intersection for the PM peak hour would decline to level of service E, resulting in an adverse effect. Implementation of the following mitigation measure would minimize the adverse effect.

Mitigation: Change Intersection Approaches at McLaughlin Avenue. The City of San Jose will be providing a programmed improvement to change the McLaughlin Avenue Approaches to remove the split phasing to provide two left turn lanes, two through lanes, and a right-turn lane on both approaches to McLaughlin Avenue. This improvement would mitigate the effect, and no further mitigation is required. The *Comprehensive County Expressway Planning Study*, which is currently underway, further recommends a third southbound left-turn lane from McLaughlin Avenue to Capitol Expressway. This addition of these lane, while improving the intersection operation, is not necessary to mitigate the adverse effect of the Light Rail Alternative

4.1.5 Design Options

The following is a discussion of the impacts and mitigation measures required for the design options.

4.1.5.1 Pedestrian Grade Separation at Story Road

No significant impact is identified, no mitigation is necessary.

4.1.5.2 Single Southbound Left Turn at Ocala Avenue

Removing one of the southbound left turn lanes results in a significant impact. The only feasible mitigation would be to maintain the existing geometry with two southbound left turn lanes.

4.1.5.3 Light Rail Side Running At-Grade at Eastridge Road and Quimby Road

Side running at-grade interferes with the ability to operate progressive signal movements along Capitol Expressway. The mitigation for this impact would be to grade separate through a depressed section or trench design for the crossing of Eastridge Road and Quimby Road.

4.1.5.4 Grade Separation at Aborn Road

There is no impact associated with the design option and no mitigation is necessary.

4.1.5.5 Grade Separation at McLaughlin

There is no impact associated with the design option and no mitigation is necessary.

4.2 Pedestrian and Bicycle Mitigation

There are no pedestrian or bicycle impacts caused by the project. To the contrary, the project improves pedestrian and bicycle movement along the corridor. The following are the pedestrian and bicycle improvements associated with the project.

- A two-way pedestrian and bicycle facility is proposed along the east/south side of the corridor from the Alum Rock Station to the Nieman Boulevard intersection.
- A sidewalk is proposed on the west/north side of the corridor for its entire length with the exception of a short segment west of Senter Road.
- The Project could accommodate connections to pedestrian and bicycle facilities.
- All existing pedestrian crosswalks and pedestrian signal indications will be maintained. At the north leg at Nieman/Capitol Expressway and at the east leg at the SR 87 southbound off-ramp to Capitol Expressway new pedestrian crosswalks and pedestrian signal indications will be added to access light rail transit platforms.
- At three locations, Story Road, Silver Creek, and Senter Road, pedestrian overcrossings are proposed to serve both passengers accessing the light rail platform as well as pedestrian traffic crossing the expressway. The station option with the platform between Ocala Avenue and Cunningham Avenue also has a pedestrian overcrossing.
- Pedestrian push buttons will be added to all location with at-grade platforms to allow disembarking passengers to call the pedestrian signal phase.
- Pedestrian audible warning devices will be installed at all intersection with at-grade pedestrian access to the light rail platform.
- If the County or City of San Jose deems it necessary, pedestrian countdown heads indicating the remaining time for a pedestrian to cross an intersection could be incorporated into the signal system at all intersections with at-grade pedestrian access to the light rail platform.

4.3 Safety & Security Mitigation

There are no specific criteria for which to measure safety impacts and mitigation. The safety of the light rail corridor will be addressed in detail as the project moves through the design and construction phases. A key part of the safety review will be the Diagnostic Field Review and Evaluation conducted by VTA, the California Public Utilities Commission (CPUC), the City of San Jose, Santa Clara County and Caltrans. At that time a hazards analysis will be prepared. The hazards analysis will address protection of all forms of travel in and along the corridor, including automobiles, light rail vehicles, pedestrians, and bicyclists.

The project will conform to CPUC General Order 143-B, along with any waivers approved by the CPUC. The alignment classification is semi-exclusive with a fenced right-of-way and at-grade crossings. According to Table 1 of G.O. 143-B, the speed between crossings is 45 mph without an automatic block signal system (ABS). At at-grade crossings the speed will be restricted to 35 mph without flashing lights and gates, unless a waiver is granted by CPUC. At this time, flashing lights and gates are not proposed by VTA. However, VTA may seek a waiver to allow light rail vehicles to travel at a speed equal to the posted speed of the expressway.

The project will be designed and constructed to meet CPUC requirements. No other safety mitigation is necessary.

The signalized intersections along Capitol Expressway currently operate with leading left turn phases. VTA has found that with the current system lagging left turn phases reduce automobile/LRV conflicts. With leading lefts, left turning motorists on the street parallel to the tracks assume that their green phase follows the phase for cross traffic. If light rail arrives at that time and pre-empts the left turn and goes to the parallel through green, some left turning motorists proceed anyway and turn in front of the LRV. With lagging lefts, motorists become accustomed to following the through phase, resulting in fewer accidents. The signal phasing on Capitol Expressway should be modified to lagging lefts with the project.

4.4 Park & Ride Mitigation

The Project proposes up to five park-and-ride facilities. At this time, park-and-ride facilities are proposed at three existing facilities, the Alum Rock station in conjunction with the Capitol Avenue light rail project, the Eastridge transit center in conjunction with the existing park-and-ride facilities, and the SR 87 station in conjunction with the existing Capitol light rail station. In addition, the project will relocate the existing Caltrain park-and-ride lot at Monterey Highway/Fehren Drive and potentially may add new park-and-ride facilities at Ocala Avenue.

The proposed park-and-ride demand in the vicinity of Ocala and Eastridge is estimated at 250 to 550 spaces. Initially, 265 spaces are proposed to be provided at the Eastridge transit center on property currently owned by VTA and on property acquired from Eastridge. Park-and-ride capacity at the low end of the demand range is proposed because the travel demand model tends to overestimate park-and-ride demand and there is extensive bus service to the Eastridge transit center. VTA has found that most light rail passengers either walk to the station or transfer from buses. While 265 spaces is expected to serve the park-and-ride demand for many years, at some point in the future, demand may exceed supply. This is a potential significant impact.

Mitigation: VTA will monitor the park-and-ride demand at Eastridge. When demand exceeds supply on a consistent basis, VTA will provide additional parking spaces by acquiring additional property, constructing parking structures, or other arrangements at the Eastridge Shopping Center.

4.4.1 Alum Rock Station

The park-and-ride facility proposed at the existing transit center has been sized to meet demand. At the Alum Rock station, the extension of light rail onto Capitol Expressway will reduce the demand since the Alum Rock station will no longer be an end-of-the-line facility. At this location parking supply will exceed demand.

4.4.2 Eastridge Transit Center

At the Eastridge Transit Center, the VTA existing park-and-ride facility will be reconfigured in conjunction with light rail and the redesign of the bus transfer facility. As part of this reconfiguration, parking to meet demand will be identified within the existing shopping center.

4.4.3 Capitol Light Rail Station

The current parking demand at the Capitol light rail station in the median of SR 87 is only a fraction of supply. The increased demand associated with Capitol Expressway light rail will be well within the supply of the existing facilities.

4.4.4 Ocala Station

At Ocala, an area at the southwest corner of the intersection has been identified as a location for potential park-and-ride. The demand at this location is estimated in conjunction with demand at the Eastridge Transit Center. Any overflow of demand at Ocala can be accommodated at Eastridge. Therefore, no mitigation is necessary.

4.4.5 Monterey Station & Transit Center

At Monterey Highway, three alternative locations have been identified to accommodate the park-and-ride demand for light rail, as well as the demand for Caltrain with a relocation of the commuter rail platform to the south. Based on projected demand, a total of 260 to 300 stalls are needed. The capacities of the three sites under consideration for the park-and-ride lot range from 260 to 500 stalls. Because the transportation model tends to overestimate park-and-ride demand and historically VTA has experienced fewer people parking at the park and ride than was projected, there would be sufficient capacity to accommodate the demand at any of the three sites considered for the Monterey Station park-and-ride lot. The park-and-ride lots at Alum Rock Station and Capitol Station are expected to have capacity enough to handle the estimated peak park-and-ride demand. Therefore, there is no impact.

4.5 On-Street Parking

Currently, on-street parking is not permitted along Capitol Expressway. The Project will not remove any parking from the expressway near any businesses and therefore, there will not be an economic impact to any adjacent businesses resulting from a loss of on-street parking. The Project will, however, remove all on-street (residential) parking on the east side of Capitol Expressway along the Capitol Avenue frontage road between Kollmar Drive and Sussex Drive. The parking demand in this location is estimated at 15 spaces. Sufficient parking supply is available immediate south of Sussex Drive to accommodate the displaced vehicles. According to VTA criteria a significant parking impact does not occur.

Appendix B (Addendum)

Constructing Light Rail and Maintaining High-Occupancy Vehicle Lanes

Constructing Light Rail and Maintaining the HOV Lanes

The Light Rail Alternative includes construction of light rail in the median of Capitol Expressway and retaining three mixed flow lanes in both directions on Capitol Expressway. This reflects the City of San Jose's position stated in the Evergreen Specific Plan and the Evergreen Specific Plan Transportation Improvements EIR that the future light rail line would replace two HOV lanes rather than two mixed flow lanes. Retaining the HOV lanes would diminish the effectiveness of the capital investment in LRT and would be inefficient from the standpoint of transportation capacity utilization because LRT and buses in HOV lanes were viewed as competing transit modes.

Although the City's position on this issue is clear in their EIR, the County had, at the time, raised the possibility and their preference of retaining the HOV lanes rather than the mixed flow lanes. Therefore, VTA considered an alternative that would provide LRT and retain four mixed flow and two HOV lanes. As compared to the Light Rail Alternative, this alternative would generally result in similar impacts, although, traffic impacts would be more severe under this alternative than the Light Rail Alternative. VTA's preliminary analysis supports the City's position that retaining six mixed flow lanes provides more person through-put than four mixed flow and two HOV lanes.

Although the alternative of maintaining the HOV lanes and instead removing two general purpose travel lanes has been rejected the following analysis is provided for informational purposes. As noted in Section 3.2.4 of the traffic report, the maximum person through volume per hour for three general purpose lanes and light rail is 4,325 persons. The maximum through person volume is reduced to 4,010 persons for two general purpose travel lanes, one HOV lane, and light rail.

Tables 1 through Table 4 summarize the effect of removing one of the general purpose travel lanes for the construction of light rail and maintaining the HOV lanes. Table 1 summarizes 2010 AM traffic operations. Table 2 summarizes the 2010 PM traffic operations. Tables 3 and 4 contain the AM and PM peak hour information for 2025 if the HOV lanes are maintained.

The first three columns of each of these tables show the No Build With HOV lanes, the No Build Without the HOV lanes, and the No Build with All Existing Lanes. The No Build with the HOV lanes assumes that a total of three traffic lanes are available in each direction. In this case the lanes are separated into two general purpose lanes and one HOV lane. In the No Build Without the HOV lanes, the three lanes are used for general purpose travel. The traffic operations improve in this second instance since the HOV lanes serve a proportionate fewer number of vehicles than the general purpose lanes. Past Silver Creek Road, the traffic operations remain identical for both scenarios. The best traffic operations occur if all of the existing lanes are maintained.

The second set of columns in the four tables, compares a Build to Eastridge (Phase 1) project With and Without the HOV lanes. Again, if the HOV lanes are maintained, the intersection delay is increased. For this option, the HOV lanes are assumed to be removed for the entire length of Capitol Expressway, whereas, they could remain past Tully. If the HOV lanes were retained past Tully, the traffic operation would be identical to the No Build With All Lanes for the intersections south of Tully.

The third set of columns compares Full Build to Highway 87 (Phase 2) With and Without HOV lanes. The previously established trends continue for this option. Past Silver Creek Road, there is no change in the results since HOV lanes do not exist west of US 101.

The next two columns compare the Baseline Alternative With and Without HOV lanes. A six-lane cross section is also assumed for the Baseline Alternative for consistent comparison between the different options. Removing the HOV lanes and operating three general purpose travel lanes results in improved traffic operations over maintaining the HOV lanes and having only two general purpose travel lanes in each direction.

Finally, two additional alternatives were analyzed. These alternatives, noted on the attached tables, manually remove traffic from the Expressway that instead uses light rail. The travel demand model used for the traffic analysis is not sensitive enough to capture improved traffic operations as a result of the light rail project. Therefore, the project line loads were removed from the traffic volumes assuming a vehicle occupancy of 1.2 persons per vehicle, (i.e., a line load of 600 passengers would remove 500 vehicles from the through movements). The two build phases, to Eastridge and to Highway 87, were analyzed. The build options without HOV lanes and with the equivalent light rail passenger traffic removed compares very favorably to the No Build No HOV scenario.

Table 1 Comparison of Maintaining HOV Lanes – 2010 AM

| Intersection | Scenario | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------|------------------------------------|-----|--------------------------|-----|-----------------------------------------|-----|----------------------------------------------------|-----|------------------------------------------|-----|--------------------------------------------|-----|----------------------------------|-----|---------------------------------------------|-----|------------------------------------|-----|----------------------------------------------------------------|-----|-----------------------------------------------------------|-----|-------------------------------------------------------------|-----|---------------------------------------------------|-----|-------|-----|
| | No Build With HOV (4 GPLs + 2 HOV) | | No Build No HOV (6 GPLs) | | No Build with All Lanes(6 GPLs + 2 HOV) | | Build to Eastridge with HOV (4 GPLs + 2 HOV + LRT) | | Build to Eastridge No HOV (6 GPLs + LRT) | | Full Build with HOV (4 GPLs + 2 HOV + LRT) | | Full Build No HOV (6 GPLs + LRT) | | No Build TSM With HOV (4GPLs + 2 HOV + TSM) | | No Build TSM No HOV (6 GPLs + TSM) | | Build Eastridge to HOV Less LRT Traffic (4 GPLs + 2 HOV + LRT) | | Build to Eastridge No HOV Less LRT Traffic (6 GPLs + LRT) | | Full Build with HOV Less LRT Traffic (4 GPLs + 2 HOV + LRT) | | Full Build No HOV Less LRT Traffic (6 GPLs + LRT) | | | |

1.0 INTRODUCTION

This report provides updated patronage forecasts for the Capitol Expressway light rail project for the year 2010 and the year 2025. The patronage forecasts were developed using the Santa Clara County Congestion Management Program travel demand model. This model is maintained by VTA in their Congestion Management Department.

1.1 Purpose of Analysis

Patronage estimates developed for the Capitol Expressway light rail project are used for several purposes. First, the number of projected LRT passengers is used to determine the rolling stock required to serve the demand. Also, the number of passengers boarding or alighting at any one station can be utilized in determining the optimal station layout and pedestrian queuing areas. Using mode of arrival, the number of parking spaces can also be determined.

1.2 Alternatives

The travel demand forecasting and patronage forecasting for the Capitol Light Rail Project considered 10 alternatives. The ten alternatives modeled by VTA were as follows:

1. No Project 2010 – the No Project 2010 alternative does not extend light rail on Capitol Avenue passed the Alum Rock station onto Capitol Expressway. A fixed rail system is however constructed on Santa Clara/Alum Rock from downtown San Jose to the Alum Rock station on Capitol Avenue. Light rail ridership statistics for this alternative are included in Table 1 of the appendix.
2. No Project 2025 – the No Project 2025 alternative has the same characteristics as the No Project 2010 with the horizon year extended another 15 years. Light rail ridership statistics for this alternative are included in Table 2 of the appendix.
3. Transportation System Management 2010 – the TSM 2010 alternative does not extend light rail on Capitol Avenue passed the Alum Rock station onto Capitol Expressway. Instead, TSM improvements are made to the Capitol Expressway corridor to improve transit accessibility and ridership. A fixed rail system is however constructed on Santa Clara/Alum Rock from downtown San Jose to the Alum Rock station on Capitol Avenue. Light rail ridership statistics for this alternative are included in Table 3 of the appendix.
4. Transportation System Management 2025 – the TSM 2025 alternative has the same characteristics as the TSM 2010 alternative with the horizon year extended another 15

years. Light rail ridership statistics for this alternative are included in Table 4 of the appendix.

5. Initial Project 2010 – the Initial Project 2010 extends light rail on Capitol Avenue and Capitol Expressway to the Eastridge transit center. A fixed rail system is also constructed on Santa Clara/Alum Rock from downtown San Jose to the Alum Rock station on Capitol Avenue. Two subalternatives were considered for this alternative. In the first option existing bus routes 22 and 300 were assumed to be replaced by light rail. Ridership statistics for this subalternative are included in Table 5a of the appendix. The second subalternative maintained bus routes 22 and 300 in addition to light rail operations. Ridership statistics for this subalternative are included in Table 5b of the appendix.
6. Initial Project 2025 – the Initial Project 2025 has the same characteristics as the Initial Project 2010 with the horizon year extended another 15 years. The same two subalternatives assumed for 2010 were carried into the 2025 projections. Table 6a in the appendix summarizes the ridership statistics for no bus routes 22 and 300 and Table 6b summarizes the ridership data if routes 22 and 300 are maintained.
7. Full Build Project 2010 – the Full Build Project 2010 extends light rail transit on Capitol Avenue and Capitol Expressway to connect to the Guadalupe light rail corridor at Capitol Expressway/State Highway 87. A fixed rail system is also constructed on Santa Clara/Alum Rock from downtown San Jose to the Eastridge station on Capitol Avenue. Ridership statistics for this alternative are summarized in Table 7 of the appendix.
8. Full Build Project 2025 – the Full Build Project 2025 has the same characteristics as the Full Build Project 2010 with the horizon year extended another 15 years. Ridership statistics for this alternative are summarized in Table 8 of the appendix.
9. Streetcar 2010 – the Streetcar 2010 alternative constructs a streetcar system on Santa Clara/Alum Rock from downtown San Jose to the Alum Rock station on Capitol Avenue. Light rail on Capitol Avenue/Capitol Expressway is extended to the Eastridge transit center with this alternative. Ridership statistics for this alternative are summarized in Table 9 of the appendix.
10. Streetcar 2025 – the Streetcar 2025 alternative has the same characteristics as the Streetcar 2010 with the horizon year extended another 15 years. Ridership statistics for this alternative are summarized in Table 10 of the appendix.

2.0 SCHEMATIC LAYOUTS OF ALTERNATIVES

The ten alternatives are schematically depicted on Figure 1 through Figure 5. The change in the horizon year does not change the physical characteristics of the alternatives. Figure 1 shows the No Project for 2010 and 2025. Light rail on Capitol Avenue stops at the Alum Rock station. Fixed rail does operate from downtown San Jose with two-car sets on 10 minutes headways. Also shown on Figure 1 is the remainder of the light rail network included in the patronage forecasts. The remainder of the system remains constant for all alternatives. The other light rail corridors include the following:

- The Guadalupe corridor from Santa Teresa to Baypoint with 3-car sets and 10-minute headways.
- The Almaden corridor from Almaden to Ohlone/Chynoweth and a transfer to Guadalupe with 1-car sets on 10-minute headways.
- The Tasman West corridor from Mountain View to the Baypointe transfer point with 2-car sets and 10-minute headways.
- The Tasman East corridor from Baypointe to Alum Rock with 2-car sets and 10-minute headways.
- The Vasona corridor from Winchester through downtown to the Younger maintenance facility with 2-car sets and 10-minute headways.

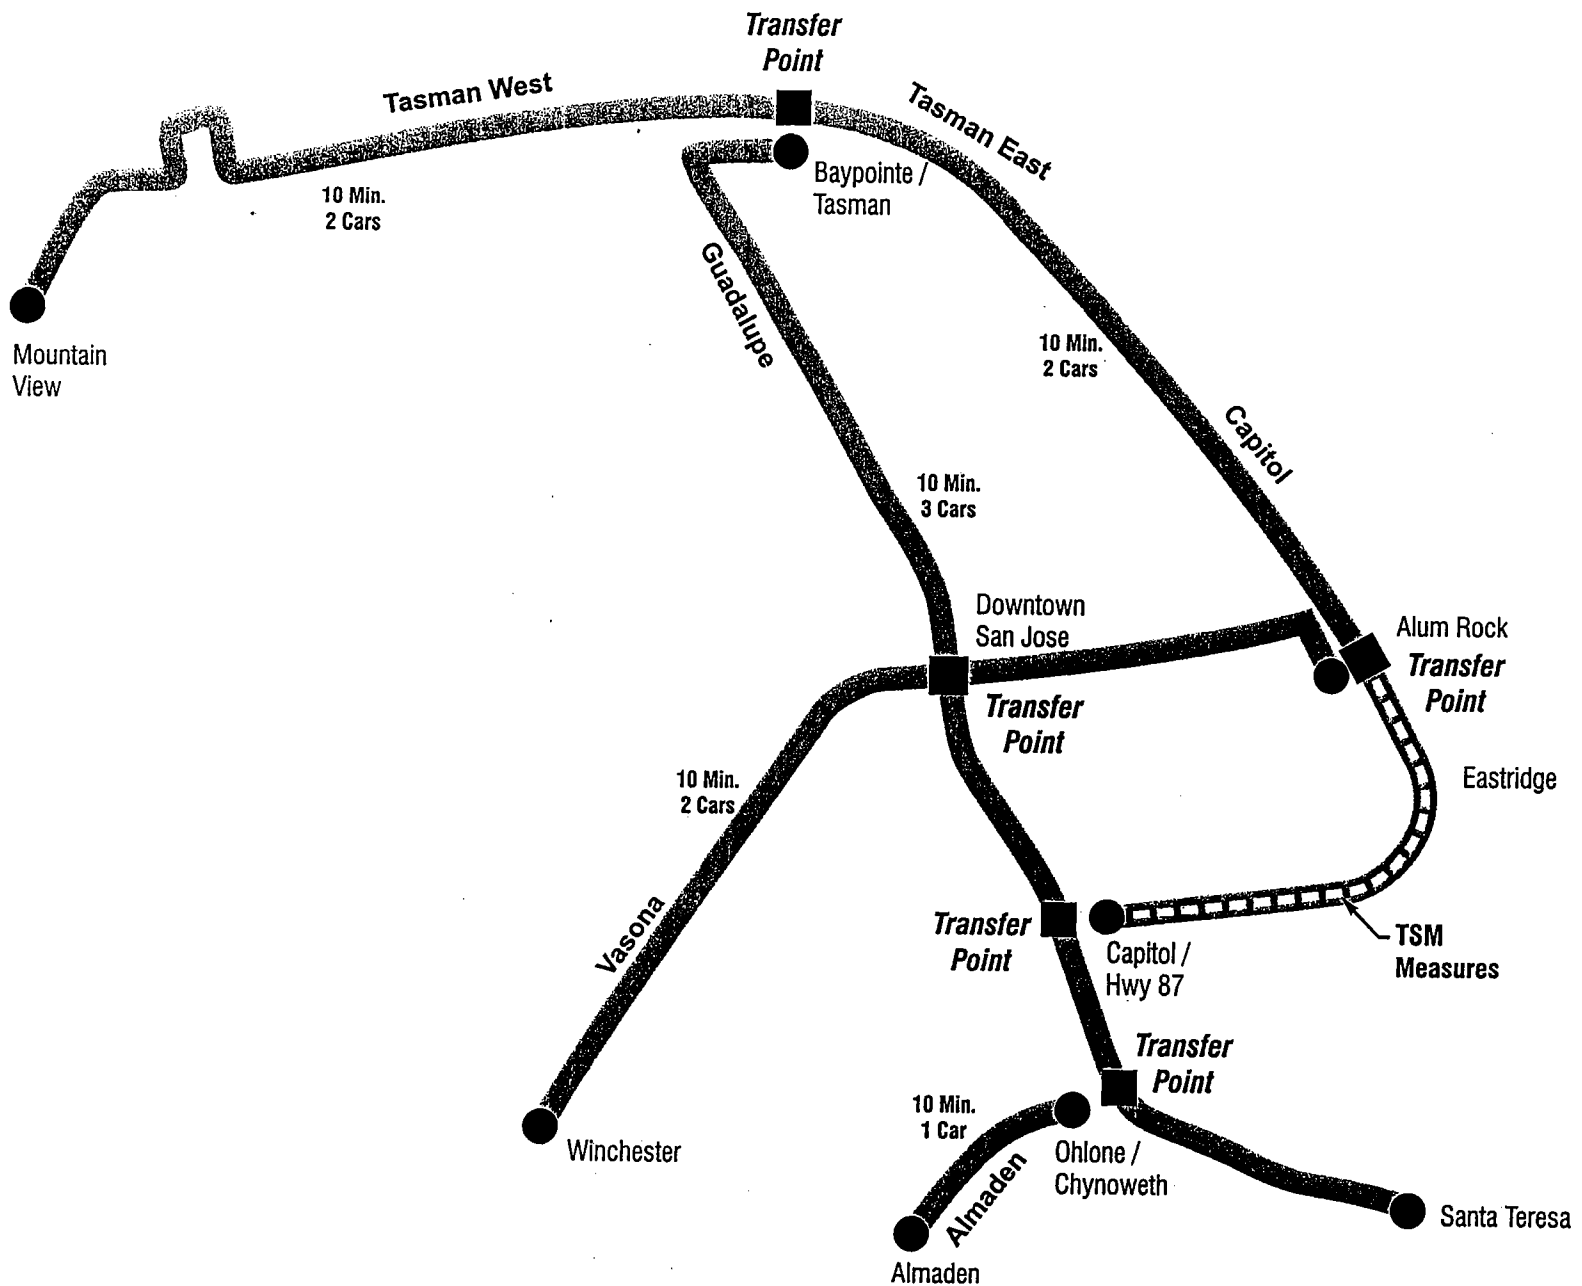

Figure 2 depicts the TSM Alternative for 2010 and 2025. TSM measures are implemented along Capitol Expressway from the Alum Rock station to the Capitol/87 station.

Figure 3 shows the Initial Project alternatives. Light rail on Capitol Expressway terminates at the Eastridge transit center.

Figure 4 illustrates the Full Build Project for 2010 and 2025. Light rail on Capitol Expressway is extended to Capitol/Highway 87 and light rail from downtown via Santa Clara/Alum Rock is extended to Eastridge.

Figure 5 shows the Streetcar alternatives. Light rail is extended from the Alum Rock station to the Eastridge transit center and the streetcars on Santa Clara/Alum Rock are assumed to operate on 5-minute headways with single car sets.

3.0 BASE NETWORK ASSUMPTIONS

Specific assumptions concerning the roadway and transit network must be included in the travel demand model. These assumptions are made separately for 2010 and 2025. The roadway and transit improvements included in the model runs are based on a realistic level of funding. Table 1 lists the roadway improvements assumed for 2010 and 2025, along with source for their inclusion. Table 2 lists the transit projects for 2010 and 2025 and also lists the funding sources. Projects are listed for Santa Clara County, as well as applicable projects in Alameda County.

4.0 MODEL RESULTS

4.1 System Ridership

Table 3 summarizes the light rail system ridership for each of the alternatives. These figures represent total daily boardings, including transfers from one light rail corridor to another corridor. Table 3 illustrates daily, AM peak, and PM peak boardings for 2010 and 2025. The No Project for Capitol Expressway results in the lowest ridership with 70,000 daily boardings in 2010 and nearly 87,000 daily boardings in 2025. For the TSM alternative, the total boardings remain nearly equal to the No Project alternative.

The Initial Project to Eastridge increases the light rail ridership by about 1,500 daily boardings over the No Project alternative in 2010 and about 3,700 daily boardings over the No Project in 2025. Maintaining bus lines 22 and 300 results in a slight decrease in light rail ridership for the Initial Project.

The Full Build Project further increases the total systemwide daily boardings by about 9,500 over the Initial Project in 2010 and 6,700 daily boardings in 2025.

Finally, the streetcar options has the greatest total systemwide daily boardings with over 80,000 daily boardings in 2010 and nearly 100,000 daily boardings in 2025.

4.2 Corridor Specific Ridership

Table 4 shows the projected ridership for various build scenarios along the Capitol Expressway corridor. The values in Table 4 represent total daily and peak hour boardings for 2010 and 2025. These values are for the Tasman West/Tasman East/Capitol corridor only. The ridership values for the No Project condition is the ridership for Tasman West/Tasman East/ Capitol Avenue corridor as depicted in Figure 1. By extending light rail from the Alum Rock station to Eastridge, the daily boardings increase by 2,250 per day in 2010 and 3,205 per day in 2025. Extending the project to Capitol/87 increases the daily by 9,790 in 2010 and by 11,075 in 2025.

Table 3 Light Rail Systemwide Ridership - Total Boardings (Including Transfers)

| Alternative | 2010 | | | 2025 | | |
|--------------------|--------|---------|---------|--------|---------|---------|
| | Daily | AM Peak | PM Peak | Daily | AM Peak | PM Peak |
| No Project | 70,000 | 11,800 | 9,030 | 86,950 | 14,250 | 11,340 |
| TSM | 70,470 | 11,860 | 9,100 | 87,000 | 14,250 | 11,280 |
| Initial Project | 71,550 | 12,120 | 9,210 | 90,650 | 15,000 | 11,900 |
| Full Build Project | 80,100 | 13,800 | 10,420 | 97,350 | 16,320 | 12,790 |
| Streetcar | 80,200 | 13,630 | 10,230 | 98,600 | 16,300 | 12,650 |

Table 4 Capitol Expressway Light Rail Ridership–Total Boardings (Including Transfers)

| Alternative | 2010 | | | 2025 | | |
|--------------------|----------|----------|----------|-----------|----------|----------|
| | Daily | AM Peak | PM Peak | Daily | AM Peak | PM Peak |
| No Project | 19,820 | 3,520 | 2,780 | 23,925 | 4,190 | 3,410 |
| Initial Project | 22,070 | 3,920 | 3,050 | 27,130 | 4,740 | 3,840 |
| | (+2,250) | (+400) | (+270) | (+3,205) | (+550) | (+430) |
| Full Build Project | 29,610 | 5,300 | 4,090 | 35,000 | 6,170 | 4,860 |
| | (+9,790) | (+1,780) | (+1,310) | (+11,075) | (+1,980) | (+1,450) |
| Streetcar | 24,070 | 4,280 | 3,250 | 28,400 | 4,970 | 3,900 |
| | (+4,250) | (+760) | (+470) | (+4,475) | (+780) | (+490) |

With a streetcar operating on Santa Clara/Alum Rock and light rail operating to Eastridge, the daily boardings are increased by 4,250 in 2010 and 4,475 in 2025. This scenario is the same as the Initial Project, except a streetcar system operates on Santa Clara/Alum Rock in each direction every five minutes. The streetcar operations cause ridership to increase by 2,000 daily boardings in 2010 and nearly 1,300 daily boardings in 2025 when compared to light rail on Santa Clara/Alum Rock operating on 10-minute headways.

4.3 Corridor Boardings

Table 5 illustrates light loadings along Capitol Expressway for the Initial Build to Eastridge and for the Full Build to Capitol/87. The figures noted in Table 5 are line loadings by direction for each peak hour.

For the Initial Build, inbound in the AM and outbound in the PM are the dominate movements. For 2010, the maximum load point is between the Alum Rock and Story stations with an hourly volume of 520 passengers. For 10-minute headways, this represents nearly 90 passengers per train. The maximum outbound load point is again between the Alum Rock and Story stations with a total volume of 405 passengers or nearly 70 per train.

Table 5 Capitol Expressway Light Rail -- Light Rail Loadings

| Alternative | Segment | 2010 | | | | 2025 | | | |
|---------------|----------------------------|------------|-------------|------------|-------------|------------|-------------|------------|-------------|
| | | AM Inbound | AM Outbound | PM Inbound | PM Outbound | AM Inbound | AM Outbound | PM Inbound | PM Outbound |
| Initial Build | Alum Rock to Story | 520 | 50 | 35 | 405 | 605 | 55 | 45 | 485 |
| | Story to Ocala | 400 | 55 | 40 | 315 | 480 | 60 | 45 | 390 |
| | Ocala to Eastridge | 230 | 55 | 35 | 185 | 285 | 65 | 45 | 240 |
| Full Build | Alum Rock to Story | 870 | 110 | 95 | 730 | 900 | 130 | 105 | 750 |
| | Story to Ocala | 800 | 125 | 110 | 655 | 830 | 150 | 125 | 685 |
| | Ocala to Eastridge | 700 | 155 | 135 | 560 | 745 | 175 | 155 | 600 |
| | Eastridge to Nieman | 630 | 170 | 155 | 485 | 695 | 195 | 175 | 550 |
| | Nieman to Silver Creek | 530 | 275 | 210 | 415 | 580 | 310 | 235 | 470 |
| | Silver creek to McLaughlin | 430 | 405 | 305 | 330 | 480 | 460 | 355 | 385 |
| | McLaughlin to Senter | 370 | 480 | 355 | 280 | 415 | 550 | 420 | 330 |
| | Senter to Monterey | 280 | 615 | 455 | 210 | 330 | 700 | 535 | 260 |
| | Monterey to Vista Park | 180 | 680 | 500 | 155 | 200 | 785 | 595 | 175 |
| | Vita Park to Capitol/87 | 140 | 730 | 540 | 125 | 155 | 835 | 635 | 145 |

In 2025, the maximum load points remain the same for the Initial Build project, with 605 inbound passengers in the AM and 485 outbound passengers in the PM between the Alum Rock and Story stations. This represents over 100 passenger per train in the AM and 80 passengers per train in the PM peak.

For the Full Build project to Capitol/87, the maximum load points are inbound at Alum Rock and outbound to Capitol/87 in the AM peak and inbound from Capitol/87 and outbound from Alum Rock in the PM. During the AM peak, the maximum load volume is 900 inbound passengers between Story and Alum Rock and 835 passengers outbound between Vista Park and Capitol/87. This represents 140 to 150 passengers per train. During the PM peak, the maximum load volume is 635 inbound passengers between Capitol/87 and Vista Park and 750 outbound passengers between Alum Rock and Story, or 105 to 125 passengers per train.

The train loadings expected for Capitol Expressway are well within the capacity of two-car trains sets. A two-car train has a seating capacity of 150 passengers and an additional 150 or more standees.

4.4 Total Pedestrian Volumes

The total passenger activity at a platform is used to assist in establishing the platform width and other pedestrian facilities at each station. Table 6 shows the total ons and offs at each station for the Initial Build and the Full Build alternatives. The total pedestrian volume noted in Table 6 are for daily, AM peak, and PM peak for both 2010 and 2025.

The greatest pedestrian volume occurs at the stations where the greatest line loads were recorded. For the Initial Build project, this occurs at the Alum Rock station with 870 AM passengers, in 2010. The next greatest activity for the Initial Build project is at Eastridge, where the total AM peak hour passengers are nearly 300. For 2025, the total passenger activity increases slightly.

Table 6 Total Pedestrian Activity Per LRT Platform

| Alternative | Station | 2010 | | | 2025 | | |
|---------------|--------------|-------|---------|---------|-------|---------|---------|
| | | Daily | AM Peak | PM Peak | Daily | AM Peak | PM Peak |
| Initial Build | Alum Rock | 4,170 | 870 | 370 | 4,335 | 875 | 400 |
| | Story | 820 | 135 | 110 | 910 | 145 | 120 |
| | Ocala | 1,050 | 180 | 145 | 1,205 | 205 | 165 |
| | Eastridge | 1,655 | 290 | 220 | 2,065 | 350 | 285 |
| Full Build | Alum Rock | 4,875 | 1,055 | 425 | 5,190 | 1,115 | 455 |
| | Story | 630 | 100 | 100 | 670 | 105 | 110 |
| | Ocala | 830 | 130 | 135 | 930 | 140 | 145 |
| | Eastridge | 1,195 | 170 | 180 | 1,450 | 205 | 220 |
| | Nieman | 1,300 | 220 | 150 | 1,610 | 260 | 190 |
| | Silver Creek | 2,050 | 380 | 235 | 2,465 | 430 | 280 |
| | McLaughlin | 795 | 145 | 110 | 960 | 175 | 135 |
| | Senter | 1,375 | 245 | 195 | 1,660 | 275 | 225 |
| | Monterey | 1,560 | 250 | 200 | 1,975 | 310 | 265 |
| | Vista Park | 565 | 100 | 75 | 630 | 110 | 85 |
| Capitol/87 | 4,615 | 870 | 665 | 5,405 | 990 | 775 | |

For the Full Build project, the AM pedestrian activity remains high at Alum Rock with over 1,000 hourly passengers for 2010, and over 1,100 for 2025. At Capitol/87 the passengers activity is high during both peaks, with 870 in the AM and 665 in the PM for 2010, and nearly 1,000 in the AM and nearly 800 in the PM peak for 2025. The next greatest level of pedestrian activity occurs at the Silver Creek with about 400 AM passengers and 300 PM passengers.

4.5 Park-and-Ride Demand

Table 7 illustrates the park-and-ride demand for the Initial Build Project and for the Full Build project. The projected park-and-ride demand is noted for both 2010 and 2025.

For the Initial Build project, the park-and-ride demand varies from 330 to 580 spaces in 2010 to 340 to 640 spaces in 2025.

For the Full Build project, the park-and-ride demand varies from 630 to 820 spaces in 2010 to 700 to 940 spaces in 2025.

The projections include 100 spaces for the relocated Caltrain station at Monterey Highway.

Table 7 Estimated Peak Park & Ride Demand
Initial Build - Light Rail to Eastridge Transit Center Only

| Station | 2010 Demand | 2025 Demand | Capacity |
|------------------------------|--------------------|--------------------|------------------|
| Alum Rock | 80 | 90 | 105 |
| Ocala/Eastridge ¹ | 250-500 | 250-550 | 265 ² |
| Total | 330-580 | 340-640 | 370 |

Notes:

- ¹ The Ocala/Eastridge area functions as a combined area and demand is calculated for both locations combined.
- ² The capacity for park-and-ride at Eastridge is estimated at 265 spaces. An additional 95 spaces could be provided at Ocala. The capacity could expand to accommodate the anticipated demand through acquiring additional property, constructing parking structures, or other arrangements at the Eastridge Shopping Center.

Full Build - Light Rail to Capitol Station (Highway 87)

| Station | 2010 Demand | 2025 Demand | Capacity |
|------------------------------|--------------------|--------------------|------------------|
| Alum Rock | 80 | 80 | 105 |
| Ocala/Eastridge ¹ | 250-310 | 250-360 | 265 ² |
| Monterey ³ | 160-260 | 200-300 | 300 |
| Capitol | 140-170 | 170-200 | 915 |
| Total | 630-820 | 700-940 | 1,585 |

Notes:

- ¹ The Ocala/Eastridge area functions as a combined area and demand is calculated for both locations combined.
- ² The capacity for park-and-ride at Eastridge is estimated at 265 spaces. An additional 95 spaces could be provided at Ocala. The capacity could expand to accommodate the anticipated demand through acquiring additional property, constructing parking structures, or other arrangements at the Eastridge Shopping Center.
- ³ The total demand at Monterey includes 100 spaces for relocated Caltrain station.

4.6 Kiss-and-Ride Demand

Table 8 summarizes the kiss-and-ride demand volumes. Kiss-and-ride demand can only be calculated for stations with park-and-ride facilities. At other locations some informal kiss-and-ride could occur with pick-ups and drop-offs occurring on-street near the light rail platforms.

The highest demand for kiss-and-ride occurs at Eastridge for the Initial Build and for the Full Build. The demand at the other station platforms varies from 5 to 10 kiss-and-ride spaces.

Table 8 Estimated Kiss-and-Ride Volumes

Initial Build - Light Rail to Eastridge Transit Center Only

| Station | 2010 Demand | 2025 Demand |
|-----------------|--------------------|--------------------|
| Alum Rock | 5 | 5 |
| Ocala/Eastridge | 20-25 | 25-30 |

Full Build - Light Rail to Capitol Station (Highway 87)

| Station | 2010 Demand | 2025 Demand |
|----------------|--------------------|--------------------|
| Alum Rock | 5 | 5 |
| Eastridge | 15-20 | 20-25 |
| Monterey | 10 | 10 |
| Capitol | 10 | 10 |

Air Quality Technical Information

Dispersion Modeling

Predicting the ambient air quality impacts of pollutant emissions requires an assessment of the transport, dispersion, chemical transformation, and removal processes that affect pollutant emissions after their release from a source. Gaussian dispersion models are frequently used for such analyses. The term “Gaussian dispersion” refers to a general type of mathematical equation used to describe the horizontal and vertical distribution of pollutants downwind from an emission source.

Gaussian dispersion models treat pollutant emissions as being carried downwind in a defined plume, subject to horizontal and vertical mixing with the surrounding atmosphere. The plume spreads horizontally and vertically, with a reduction in pollutant concentrations as it travels downwind. Mixing with the surrounding atmosphere is greatest at the edge of the plume, resulting in lower pollutant concentrations outward (horizontally and vertically) from the center of the plume. This decrease in concentration outward from the center of the plume is treated as following a Gaussian (“normal”) statistical distribution. Horizontal and vertical mixing generally occur at different rates. Because turbulent motions in the atmosphere occur on a variety of spatial and time scales, vertical and horizontal mixing also vary with distance downwind from the emission source.

CALINE4 Model

The ambient air quality effects of traffic emissions were evaluated using the CALINE4 dispersion model (Benson 1989). CALINE4 is a Gaussian dispersion model specifically designed to evaluate air quality impacts of roadway projects. Each roadway link analyzed in the model is treated as a sequence of short segments. Each segment of a roadway link is treated as a separate emission source producing a plume of pollutants that disperses downwind. Pollutant concentrations at any specific location are calculated using the total contribution from overlapping pollution plumes originating from the sequence of roadway segments.

When winds are essentially parallel to a roadway link, pollution plumes from all roadway segments overlap, producing high concentrations near the roadway (near the center of the overlapping pollution plumes) and low concentrations well away from the roadway (at the edges of the overlapping pollution plumes). When winds are at an angle to the roadway link, pollution plumes from distant roadway segments make essentially no contribution to the pollution concentration observed at a receptor location. Under such cross-wind situations, pollutant concentrations near the highway are lower than under parallel wind conditions (fewer overlapping plume contributions), while pollutant concentrations away from the highway may be greater than would occur with parallel winds (near the center of at least some pollution plumes).

The CALINE4 model employs a “mixing cell” approach to estimating pollutant concentrations over the roadway itself. The size of the mixing cell over each roadway segment is based on the width of the traffic lanes of the highway (generally 12 feet per lane) and an additional turbulence zone on either side (generally 10 feet on each side). Parking lanes and roadway shoulders are not counted as traffic lanes. The height of the mixing cell is calculated by the model.

Pollutants emitted along a highway link are treated as being well mixed within the mixing cell volume due to mechanical turbulence from moving vehicles and convective mixing due to the temperature of vehicle exhaust gases. Pollutant concentrations downwind from the mixing cell are calculated using horizontal and vertical dispersion rates that are a function of various meteorological and ground surface conditions.

Modeling Procedures

Roadway and Traffic Conditions

Traffic volumes and operating conditions used in the modeling were obtained from the traffic analysis for the Capitol Expressway Corridor (Korve Engineering 2003). Free-flow traffic speeds were adjusted to reflect congested speeds using methodology from the *Highway Capacity Manual* (Transportation Research Board 2000). Carbon monoxide (CO) modeling was conducted for the following intersections: Capitol Expressway/Capitol Avenue/Excalibur Drive, Capitol Expressway/Story Road, and Capitol Expressway/Silver Creek Road. CO modeling was performed for 2010 and 2025 PM peak no project and baseline conditions.

Vehicle Emission Rates

Vehicle emission rates were determined using the California Air Resources Board’s EMFAC7F (version 1.1) emission rate program. A cold-start percentage of 10% and a hot-start percentage of 50% were assumed.

Receptor Locations

CO concentrations were estimated at four receptor locations at each of the proposed intersections. The receptors are placed at 100 feet away from the center of each roadway. Receptor heights were set at 5.9 feet.

Meteorological Conditions

Meteorological inputs to the CALINE4 model were determined using methodology recommended in *Air Quality Technical Analysis Notes* (California Department of Transportation 1988). The meteorological conditions used in the modeling represent a calm winter period. Worst-case wind angles were modeled to determine a worst-case concentration for each receptor. The meteorological inputs include 1-meter-per-second wind speed, ground-level temperature inversion (atmospheric stability class G), wind direction standard deviation equal to five degrees, and a mixing height of 1,000 meters.

Background Concentrations and 8-Hour Values

Background concentration of 7.0 parts per million was added to the modeled future 1-hour values to account for sources of CO not included in the modeling. Eight-hour modeled values were calculated from the 1-hour values using a persistence factor of 0.7. Background concentration of 5.2 parts per million was added to the modeled future 8-hour values. All background concentration data were taken from the Bay Area Air Quality Management District's California Environmental Quality Act guidelines. Actual 2025 background concentrations would likely be lower than those used in the CO modeling analysis because 2010 value was applied as background concentration for both future conditions.

Biological Resources Information

Appendix E-1

Special-Status Species Tables

Table E-1a. Special-Status Plant Species with Potential to Occur in the Capitol Expressway Corridor

| Common Name <i>Scientific Name</i> | Status Federal/State/CNPS** | California Distribution | Habitats | Flowering Period | Potential for Occurrence in Capitol Expressway Corridor |
|---------------------------------------------------------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Heartscale <i>Atriplex cordulata</i> | SC/—/1B | Western Central Valley and valleys of adjacent foothills, at elevations below 660 feet. | Alkali grasslands, alkali meadows, alkali scrublands | May– October | No records of species in Capitol Expressway Corridor. No suitable habitat exists in the study area. |
| Large-flowered fiddleneck <i>Amsinckia grandiflora</i> | E/E/1B | Foothills of Mt. Diablo below 1,200 feet, in Alameda, Contra Costa, and San Joaquin Counties; currently known from only three natural occurrences. | Open grassy slopes in annual grasslands and cismontane woodlands | April– May | No records of species in Capitol Expressway Corridor. Highly unlikely to occur; nearest record of this species is on Lawrence Livermore National Laboratory Site 300, over 10 miles east of the Capitol Expressway Corridor. |
| Caper-fruited tropidocarpum <i>Tropidocarpum capparideum</i> | SC/—/1A | Presumed extinct (presumed extirpated in Alameda, Contra Costa, Glenn, Monterey, Santa Clara, and San Joaquin Counties). | Alkaline valley and foothill grasslands. Elevation: 1–455 meters | March– April | One record of species in Capitol Expressway Corridor (from 1907). Highly unlikely to occur; presumed extinct. |
| Congdon’s tarplant <i>Hemizonia parryi</i> ssp. <i>congdonii</i> | SC/—/1B | Alameda, Contra Costa, Monterey, San Luis Obispo, and Santa Clara Counties; presumed extirpated in Santa Cruz and Solano Counties. | Alkaline soils of valley and foothill grasslands. Elevation: 1–215 meters | June– November | No records of species in Capitol Expressway Corridor. No suitable habitat exists in the Capitol Expressway Corridor. |
| Big tarplant <i>Blepharizonia plumosa</i> ssp. <i>Plumosa</i> | —/—/1B | Interior Coast Range foothills in Alameda, Contra Costa, San Joaquin, Stanislaus, and Solano Counties, at elevations of 650–2,600 feet. | On dry hills and plains in annual grasslands. | July– October | No records of species in Capitol Expressway Corridor. Species is unlikely to occur because suitable habitat is sparse or absent. Nearest populations are over 4 miles away near Arroyo Seco. |
| Hairless popcornflower <i>Plagiobothrys glaber</i> | —/—/1A | Presumed extinct (presumed extirpated in Alameda, Marin, Merced, San Benito, and Santa Clara Counties). | Alkaline meadows, coastal marshes. Elevation: 15–180 meters | March– May | Two records of species in Capitol Expressway Corridor (from 1892 and 1955). Highly unlikely to occur; presumed extinct. |

Table E-1a. Continued.

| Common Name <i>Scientific Name</i> | Status Federal/State/CNPS** | California Distribution | Habitats | Flowering Period | Potential for Occurrence in Capitol Expressway Corridor |
|-----------------------------------------------------------------------------------|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Contra Costa Goldfields <i>Lasthenia conjugens</i> | E/—/1B | Scattered occurrences in Coast Range valleys and southwest edge of Sacramento Valley, Alameda, Contra Costa, Mendocino, Napa, Santa Barbara*, Santa Clara*, and Solano Counties. Historically distributed through the north coast, southern Sacramento Valley, San Francisco Bay region and the south coast. | Alkaline or saline vernal pools and swales, below 700 feet | March– June | One record of species in Capitol Expressway Corridor. No suitable habitat exists in the Capitol Expressway Corridor. |
| Santa Clara Valley dudleya <i>Dudleya stchellii</i> | E/—/1B | Santa Clara County | Cismontane woodland, valley and foothill grassland, serpentinite, rocky | May–June | Several records of species in Capitol Expressway Corridor. No suitable habitat exists in the Capitol Expressway Corridor. |
| Metcalf Canyon jewelflower <i>Streptanthus albidus</i> ssp. <i>Albidus</i> | E/—/1B | Santa Clara County | Valley and foothill grassland, on serpentinite | April–July | One record of species in Capitol Expressway Corridor. No suitable habitat exists in the Capitol Expressway Corridor. |
| Point Reyes bird's beak <i>Cordylanthus maritimus</i> ssp. <i>palustris</i> | SC/—/1B | Humboldt, Marin, and Sonoma Counties; presumed extirpated in Alameda, San Mateo, and Santa Clara Counties. | Coastal salt marshes. Elevation: 0–10 meters | June– October | No records of species in Capitol Expressway Corridor. No suitable habitat exists in the Capitol Expressway Corridor. |
| Robust spineflower <i>Chorizanthe robusta</i> | E/—/1B | Central coastal California, Alameda*, Monterey, San Francisco*, San Mateo*, Santa Clara*, and Santa Cruz Counties | Coastal bluff scrub, coastal dunes openings in cismontane woodland, on sandy soil | May– September | One record of species in Capitol Expressway Corridor (from 1882). No suitable habitat exists in the Capitol Expressway Corridor. |

Table E-1a. Continued.

| Common Name <i>Scientific Name</i> | Status Federal/State/CNPS** | California Distribution | Habitats | Flowering Period | Potential for Occurrence in Capitol Expressway Corridor |
|-----------------------------------------------------------------------|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------|
| Mt. Hamilton thistle <i>Cirsium fontinale</i> var. <i>campylon</i> | SC/—/1B | Mt. Hamilton Range, eastern San Francisco Bay Area, Alameda, Santa Clara, and Stanislaus Counties. | Freshwater seeps and streams on serpentine outcrops, chaparral, cismontaine woodland, valley and foothill grassland, 1,000–2,500 feet | April–October | Three records of species in Capitol Expressway Corridor. No suitable habitat exists in the Capitol Expressway Corridor. |
| South Bay clarkia <i>Clarkia concinna</i> ssp. <i>Autmixa</i> | SC/—/1B | Southern San Francisco Bay foothills, Alameda and Santa Clara Counties | Shaded mesic oak woodland below 5,000 feet | April–July | No records of species in Capitol Expressway Corridor. No suitable habitat exists in the Capitol Expressway Corridor. |
| Fragrant fritillary <i>Fritillaria liliacea</i> | SC/—/1B | Coast Ranges from Marin County to San Benito County | Adobe soils of interior foothills, coastal prairie, coastal scrub, annual grassland, often on serpentinite, below 1,350 feet | February–April | One record of species in Capitol Expressway Corridor. No suitable habitat exists in the Capitol Expressway Corridor. |
| Hall's bush mallow <i>Malacothamnus hallii</i> | —/—/1B | Alameda, Contra Costa, Merced, Santa Clara, and Stanislaus Counties | Chaparral between 30–2,500 feet | May–September | Two records of species in Capitol Expressway Corridor. No suitable habitat exists in the Capitol Expressway Corridor. |
| San Joaquin spearscale <i>Atriplex joaquiniana</i> | SC/—/1B | Alameda, Contra Costa, Glenn, Merced, Monterey, Napa, Sacramento, San Benito, Solano, and Yolo Counties; presumed extirpated in San Joaquin, Santa Clara, and Tulare Counties. | Chenopod scrub, meadows, playas, alkaline valley and foothill grasslands. Elevation: 1–320 meters | April–October | No records of species in Capitol Expressway Corridor. No suitable habitat exists in the Capitol Expressway Corridor. |

* Extirpated from county.

Table E-1b. Special-Status Wildlife Species with Potential to Occur in the Capitol Expressway Corridor

| Common Name <i>Scientific Name</i> | Status* Federal/State | California Distribution | Habitat | Reason for Decline/Concern | Potential for Occurrence in Capitol Expressway Corridor |
|-----------------------------------------------------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Invertebrates | | | | | |
| Opler's longhorn moth <i>Adela oplerella</i> | SC/— | Marin County and Oakland area on the inner Coast Ranges to Santa Clara County. One record from Santa Cruz County | Serpentine substrates that support the host plant, cream cups (<i>Platystemon californicus</i>) | Unknown | One recorded observation in Upper Hellyer Canyon. No suitable habitat present in Capitol Expressway Corridor. |
| Edgewood blind harvestman <i>Calicina (=Sitalcina) minor</i> | SC/— | Santa Clara and San Mateo Counties | Open grassland in areas with serpentine bedrock | Unknown | No habitat within the Capitol Expressway Corridor |
| Bay checkerspot butterfly <i>Euphydryas editha bayensis</i> | T/— | Lowlands of Santa Clara, San Mateo, Alameda, Contra Costa, and San Francisco Counties, on serpentine soils. | Serpentine soil outcrops that support host plants: <i>Plantago erecta</i> , <i>Castilleja densiflorus</i> , and <i>Castilleja exserta</i> . | Loss of habitat as a result of urbanization and fragmentation. | One recorded observation between Silver Creek and U.S. 101. No suitable habitat present in Capitol Expressway Corridor. |
| Amphibians | | | | | |
| California red-legged frog <i>Rana aurora draytonii</i> | T/SSC | Coast and coastal mountain ranges of California from Humboldt County south to San Diego County; Sierra Nevada (above 1,000 feet) from Butte to Fresno County. | Permanent and semipermanent aquatic habitats (such as creeks and cold water ponds) with emergent and submergent vegetation and riparian species along the edges; may estivate in rodent burrows or cracks during dry periods. | Alteration of stream and wetland habitats; historical overharvesting; habitat destruction; competition and predation by non-native fish and bullfrogs. | No recorded observations. Suitable habitat present at Coyote Creek and smaller streams within Capitol Expressway Corridor. |
| California tiger salamander <i>Ambystoma californiense</i> | C/SSC | Central Valley, including Sierra Nevada foothills to elevations of approximately 1,000 feet; coastal region from Butte County south to Santa Barbara County. | Larvae use small ponds, lakes, or vernal pools in grasslands and oak woodlands; adults use rodent burrows, rock crevices, or fallen logs for cover and for estivation. | Loss of grasslands, vernal pools, and other wetlands as a result of agricultural development and urbanization. | Several recorded observations; no breeding habitat exists within Capitol Expressway Corridor. |

Table E-1b. Continued.

| Common Name <i>Scientific Name</i> | Status* Federal/State | California Distribution | Habitat | Reason for Decline/Concern | Potential for Occurrence in Capitol Expressway Corridor |
|------------------------------------------------------------------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Western spadefoot toad <i>Scaphiopus hammondi</i> | SC/SSC | Sierra Nevada foothills; Central Valley; Coast Ranges; coastal Counties in southern California. | Shallow streams with riffles; seasonal wetlands such as vernal pools in annual grasslands and oak woodlands. | Alteration of stream habitats by urbanization and hydroelectric projects; loss of seasonal wetlands and vernal pools. | No recorded observations in Capitol Expressway Corridor. Capitol Expressway Corridor is likely outside range of species. |
| Reptiles | | | | | |
| Silvery legless lizard <i>Anniella pulchra pulchra</i> | SC/SSC | Along the Coast, Transverse, and Peninsular Ranges from Contra Costa County to San Diego County with spotty occurrences in the San Joaquin Valley | Habitats with loose soil for burrowing or thick duff or leaf litter; often forages in leaf litter at plant bases; may be found on beaches, sandy washes, and in woodland, chaparral, and riparian areas | Unknown | No recorded observations or suitable habitat within Capitol Expressway Corridor. |
| California horned lizard <i>Phrynosoma coronatum frontale</i> | SC/— | Lowlands throughout California. | Sandy washes with open areas for sunning, bushes for cover, and loose soil for burrowing; near food sources (ants/other insects). | Urban encroachment on habitat. | No recorded observations or suitable habitat within Capitol Expressway Corridor. |
| Southwestern pond turtle <i>Clemmys marmorata pallida</i> | SC/SSC | Occurs along the central coast of California east to the Sierra Nevada and along the southern California coast inland to the Mojave and Sonora Deserts; range overlaps with that of the northwestern pond turtle throughout the Delta and in the Central Valley | Woodlands, grasslands, and open forests; aquatic habitats, such as ponds, marshes, or streams, with rocky or muddy bottoms and vegetation for cover and food | Loss and alteration of aquatic and wetland habitats; habitat fragmentation. | Recorded observations within the Capitol Expressway Corridor. Suitable habitat exists within Capitol Expressway Corridor. |

Table E-1b. Continued.

|-----------------------------------------------------------------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| Birds | | | | | |
| Little willow flycatcher <i>Empidonax traillii brewsteri</i> | SC/E | Summer range includes a narrow strip along the eastern Sierra Nevada from Shasta County to Kern County, another strip along the western Sierra Nevada from El Dorado County to Madera County; widespread in migration | Riparian areas and large, wet meadows with abundant willows for breeding; usually found in riparian habitats or edges of clear-cuts during fall migration | Loss of riparian breeding habitat, nest parasitism by brown-headed cowbirds | May occur in Capitol Expressway Corridor as migrant only. |
| Bell's sage sparrow <i>Amphispiza belli belli</i> | SC/SSC | Western Sierra Nevada foothills from El Dorado County south to Mariposa County, inner Coast Ranges from Shasta County southward, extending to vicinity of coast from Marin County to San Diego County; from southern San Benito County to San Bernardino County | Prefers chaparral habitats dominated by chamise | Unknown | No recorded observations or suitable habitat within Capitol Expressway Corridor. |
| Grasshopper sparrow <i>Ammodramus savannarum</i> | —/SSC | Sierra foothills, Coast Ranges, and coastal areas from Mendocino County south to San Diego County | Dry grasslands with scattered shrubs for song perches | Loss of habitat from urbanization in south coastal areas; has probably always been rare and localized elsewhere in the state | No recorded observations; no suitable habitat within Capitol Expressway Corridor. |

Table E-1b. Continued.

| Common Name <i>Scientific Name</i> | Status* Federal/State | California Distribution | Habitat | Reason for Decline/Concern | Potential for Occurrence in Capitol Expressway Corridor |
|-------------------------------------------------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Burrowing owl <i>Athene cunicularia</i> | SC/SSC | Lowlands throughout California, including the Central Valley, northeastern plateau, southeastern deserts, and coastal areas; rare along the south coast. | Uses rodent burrows in sparse grassland, desert, and agricultural habitats. | Loss of habitat; human disturbance at nesting burrows. | Several observations have been recorded in suitable habitat within the Capitol Expressway Corridor. |
| Short eared owl <i>Asio flammeus</i> | —/SSC | Permanent resident along the coast from Del Norte County to Monterey County although very rare in summer north of San Francisco Bay, in the Sierra Nevada north of Nevada County, in the plains east of the Cascades, and in Mono County; small, isolated populations | Freshwater and salt marshes, lowland meadows, and irrigated alfalfa fields; needs dense tules or tall grass for nesting and daytime roosts | Unknown | No recorded observations; no suitable habitat within the Capitol Expressway Corridor. |
| Cooper's hawk <i>Accipiter cooperii</i> | —/SSC | Throughout California except at high elevations in the Sierra Nevada. Wintering populations use the Central Valley, the southeastern desert regions, and the plains east of the Cascade Range. | Nests primarily in riparian forests dominated by deciduous species; also nests in densely canopied forests from foothill pine-oak woodland up to ponderosa pine; forages in open woodlands. | Human disturbance at nest sites; loss of riparian habitats, especially in the Central Valley; pesticide contamination. | No recorded observations in the Capitol Expressway Corridor. Suitable habitat is present in riparian areas within Capitol Expressway Corridor. |
| Loggerhead shrike <i>Lanius ludovicianus</i> | —/SSC | Grasslands throughout the state. | Forages in grassland or ruderal habitats. | Loss of grassland habitat as a result of urban expansion. | No recorded observations in Capitol Expressway Corridor; suitable habitat is present. |

Table E-1b. Continued.

| Common Name <i>Scientific Name</i> | Status* | California Distribution | Habitat | Reason for Decline/Concern | Potential for Occurrence in Capitol Expressway Corridor |
|---------------------------------------------------------------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| California clapper rail <i>Rallus longirostris obsoletus</i> | E/T | Salt and brackish marshes along San Francisco Bay. | Salt marshes with multiple tidal channels and vegetation dominated by cordgrass, pickleweed, and marsh gumplant. | Habitat loss and alteration as a result of filling, diking, and dredging. | No recorded observations in the Capitol Expressway Corridor. Suitable habitat absent from project area. |
| Northern harrier <i>Circus cyaneus</i> | —/SSC | Marshes, fields, grasslands, and prairies throughout North America. | Coastal salt and freshwater marsh; nests on ground in shrubby vegetation, usually near marsh edge, or in grasslands; forages in grasslands. | Habitat loss as a result of urbanization and agricultural development; pesticide contamination. | No recorded observations in the Capitol Expressway Corridor. Suitable habitat is present. |
| Peregrine falcon <i>Falco peregrinus anatum</i> | Delisted/E | In California, breeding range now includes the Klamath and Cascade Ranges, the inland north-coastal mountains, the Sierra Nevada, and the Channel Islands. | Prefers sites near open areas but with nearby cliffs for nesting and roosting; found in wetlands, grasslands, and tundra, in open forest, and in mountains. Will occasionally nest on the ledges of tall buildings or bridges in cities. | Pesticide contamination; robbing of eyries by falconers; illegal shooting; human disturbance at nest sites. | No recorded observations; nesting habitat absent from Capitol Expressway Corridor. |
| Salt marsh common yellowthroat <i>Geothlypis trichas sinuosa</i> | —/SSC | Fresh and brackish marshes of the San Francisco Bay Area. | Freshwater and brackish marshes with emergent vegetation. | Loss of habitat resulting from dredging, diking, and filling of marsh habitats. | No recorded observations in the Capitol Expressway Corridor. Suitable habitat is sparse or absent. |
| Tricolored blackbird <i>Agelaius tricolor</i> | SC/— | From southern Oregon south through the Central Valley and into Baja California. | Cattail and tule marshes; open valleys and foothills. | Loss of habitat resulting from dredging, diking, and filling of marsh habitats. | No recorded observations in the Capitol Expressway Corridor. Suitable habitat is sparse or absent. |

Table E-1b. Continued.

|---------------------------------------------------------------------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Yellow warbler <i>Dendroica petechia brewsteri</i> (nesting) | —/SSC | Nests over all of California except the Central Valley, the Mojave Desert region, and high altitudes and the eastern side of the Sierra Nevada. Winters along the Colorado River and in parts of Imperial and Riverside Counties. Two small permanent populations in San Diego and Santa Barbara Counties | Nests in riparian areas dominated by willows, cottonwoods, sycamores, or alders or in mature chaparral; may also use oaks, conifers, and urban areas near stream courses | Unknown | No recorded observations in the Capitol Expressway Corridor. May occur in riparian habitat within the project Capitol Expressway Corridor. |
| California black rail <i>Laterallis jamaicensis coturniculus</i> | —/T (FP) | San Francisco Bay Area, Sacramento–San Joaquin Delta, coastal southern California including Morro Bay and others, Salton Sea, and Lower Colorado River area. | Saline, brackish, and fresh emergent wetlands. | Significant loss of salt and freshwater wetland habitat. Loss of higher wetlands around San Francisco Bay has eliminated breeding in the area. | No recorded observations in the Capitol Expressway Corridor. Suitable habitat is sparse or absent. |
| Horned lark <i>Eremophila alpestris aetia</i> | —/SSC | Coastal California from Sonoma County southeast to the Mexico border, including San Joaquin Valley and the Sierra Nevada foothills. | Open habitats with few trees, including level or gently sloping short grass prairie, montane meadows, coastal plains, fallow grain fields, alkali flats. | Loss and fragmentation of habitat from urbanization, and mortality due to pesticides and mowing. | No recorded observations in the Capitol Expressway Corridor. Suitable habitat is sparse or absent. |
| White-tailed kite <i>Elanus leucurus</i> | SC/SSC (FP) | Year-round resident in Oregon and California except at high elevations. | Low rolling foothills and valley margins with scattered oaks for nesting and perching; river bottomland and associated marsh habitat; open grassland. | Habitat loss as a result of urbanization. | Nests locally; known to occur in the region. |

Table E-1b. Continued.

|---------------------------------------------------------------------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| Salt marsh harvest mouse <i>Reithrodontomys raviventris</i> | E/— | Saline wetlands of San Francisco Bay. Southern subspecies (<i>R. r. raviventris</i>) occupies San Mateo, Alameda, and Santa Clara Counties. | Salt marsh habitat that supports large stands of pickleweed. | Loss of habitat resulting from dredging and filling of pickleweed marshes around San Francisco Bay. | No recorded observations in the Capitol Expressway Corridor. Suitable habitat is absent. |
| San Francisco dusky footed woodrat <i>Neotoma fuscipes annectens</i> | SC/SSC | West side of Mount Diablo to coast and San Francisco Bay | Present in chaparral habitat and in forest habitats with a moderate understory | Unknown | No recorded observations in Capitol Expressway Corridor; suitable habitat absent. |
| Western mastiff bat <i>Eumops perotis</i> | SC/SSC | Eastern San Joaquin Valley from El Dorado County south through Kern County; Coast Ranges, Peninsular Range, and Transverse Ranges from San Francisco to the Mexico border. | Roosts and breeds in deep, narrow rock crevices; may also use crevices in trees, buildings, and tunnels. Forages in a variety of semiarid to arid habitats. | Unclear; possibly insecticide contamination and loss of foraging habitat; possibly disturbance of roosting sites. | No recorded observations in Capitol Expressway Corridor; suitable habitat absent. |
| Townsend's western big-eared bat <i>Plecotus townsendii townsendii</i> | SC/SSC | Coastal regions from Del Norte County south to Santa Barbara County. | Roosts in caves, tunnels, mines, and dark attics of abandoned buildings. | Unclear; possibly human disturbance of roosting sites. | No recorded observations in Capitol Expressway Corridor; suitable habitat present. |
| Pallid bat <i>Antrozous pallidus</i> | —/SSC | At low elevations throughout California. | Roosts in rocky outcrops, cliffs, and crevices; requires access to open habitats for foraging. | Human disturbance of roosting sites. | No recorded observations in Capitol Expressway Corridor; suitable habitat absent. |
| Long-legged myotis <i>Myotis volans</i> | SC/— | Mountains throughout California, including ranges in the Mojave desert | Most common in woodlands and forests above 4,000 feet, but occurs from sea level to 11,000 feet | Unknown | No recorded observations in Capitol Expressway Corridor; suitable habitat is present. |

| Common Name <i>Scientific Name</i> | Status* Federal/State | California Distribution | Habitat | Reason for Decline/Concern | Potential for Occurrence in Capitol Expressway Corridor |
|-----------------------------------------------------------------------|--------------------------|--------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| Long-eared myotis <i>Myotis evotis</i> | SC/— | Occurs throughout California except the southeastern deserts and the Central Valley | Occurs primarily in high elevation coniferous forests, but also found in mixed hardwood/conifer, high desert, and humid coastal conifer habitats | Unknown | No recorded observations in Capitol Expressway Corridor; suitable habitat is present. |
| Yuma myotis <i>Myotis yumanensis</i> | SC/— | Common and widespread throughout most of California except the Colorado and Mojave Deserts | Found in a wide variety of habitats from sea level to 11,000 feet, but uncommon above 8,000 feet. Optimal habitat is open forests and woodlands near water bodies | Unknown | No recorded observations in Capitol Expressway Corridor; suitable habitat is present. |
| San Joaquin kit fox <i>Vulpes macrotis mutica</i> | E/E | Valley floor and adjacent low foothills of the San Joaquin Valley. | Open grassland. | Loss of habitat resulting from agriculture and urbanization. | No recorded observations in Capitol Expressway Corridor. Capitol Expressway Corridor is likely outside range of species. |
| Fish | | | | | |
| Central California Coast ESU steelhead <i>Onchorhynchus mykiss</i> | T/SSC | Freshwater streams from Russian River to Soquel Creek, Santa Cruz County, inclusive. | Cold, clear water with clean gravel of appropriate size for spawning. Most spawning occurs in headwater streams. Steelhead migrate to the ocean to feed and grow until sexually mature. | Habitat degradation, restricted access to spawning habitat; increased water temperatures and sedimentation; decreased water quality; flow alterations | No recorded observations in Capitol Expressway Corridor; suitable habitat is present in Coyote Creek. |

| Common Name <i>Scientific Name</i> | Status* | California Distribution | Habitat | Reason for Decline/Concern | Potential for Occurrence in Capitol Expressway Corridor |
|------------------------------------------------------------|---------|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| Fall-run chinook salmon <i>Oncorhynchus tshawytscha</i> | C/SSC | Sacramento River and its tributaries, San Joaquin River and its tributaries; tributaries to the south San Francisco Bay | Cool, clear water with spawning gravel; migrate to the ocean to feed and grow until sexually mature | Reduced access to spawning habitat; habitat degradation | No recorded observations in Capitol Expressway Corridor; suitable habitat is present in Coyote Creek. |

* Status explanations:

Federal

E = listed as endangered under the federal Endangered Species Act (ESA)

T = listed as threatened under the federal ESA

PR = protected under the federal Golden Eagle Protection Act

C = federal candidate species (formerly Category 1; may be proposed for listing in the future)

SC = species of concern

State

E = listed as endangered under the California Endangered Species Act (CESA)

T = listed as threatened under the CESA

SSC = state species of special concern

FP = fully protected

— = no designation

FISH AND WILDLIFE SERVICE

Sacramento Fish and Wildlife Office
2800 Cottage Way, Room W-2605
Sacramento, California 95825

IN REPLY REFER TO:

1-1-03-SP-0160

October 28, 2002

Mr. Brook Vinnedge
Wildlife Biologist
Jones and Stokes
268 Grand Avenue
Oakland, California 94610

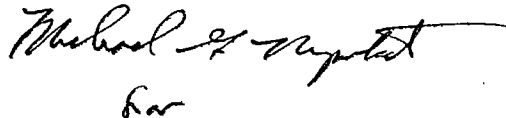

Subject: Species List for Santa Clara Valley Transportation Authority Capitol Expressway Light Rail Transit Project, Santa Clara County, California

Dear Mr. Vinnedge:

We are sending the enclosed list in response to your October 17, 2002, request for information about endangered and threatened species (Enclosure A). The list covers the following U.S. Geological Survey 7½ minute quad or quads: San Jose West and San Jose East Quads.

Please read *Important Information About Your Species List* (enclosed). It explains how we made the list and describes your responsibilities under the Endangered Species Act. Please contact Tracy Davis at (916) 414-6625, if you have any questions about the attached list or your responsibilities under the Endangered Species Act. For the fastest response to species list requests, address them to the attention of Species Lists at this address. You may fax requests to 414-6712 or 414-6713. You may also email them to harry_mossman@fws.gov.

Sincerely,

for

Jan C. Knight
Chief, Endangered Species Division

Enclosures

Important Information About Your Species List

How We Make Species Lists

We store information about endangered and threatened species lists by U.S. Geological Survey 7½ minute *quads*. The United States is divided into these quads, which are about the size of San Francisco. If you requested your list by quad name or number, that is what we used. Otherwise, we used the information you sent us to determine which quad or quads to use.

Animals

The animals on your species list are ones that occur within, *or may be affected by projects within*, the quads covered by the list. Fish and other aquatic species appear on your list if they are in the same watershed as your quad or if water use in your quad might affect them. Amphibians will be on the list for a quad or county if pesticides applied in that area may be carried to their habitat by air currents. Birds are shown regardless of whether they are resident or migratory. Relevant birds on the county list should be considered regardless of whether they appear on a quad list.

Plants

Any plants on your list are ones *that have actually been observed* in the quad or quads covered by the list. We have also included either a county species list or a list of species in nearby quads. We recommend that you check your project area for these plants. Plants may exist in an area without ever having been detected there.

Surveying

Some of the species on your list may not be affected by your project. A trained biologist or botanist, familiar with the habitat requirements of the species on your list, should determine whether they or habitats suitable for them may be affected by your project. We recommend that your surveys include any proposed and candidate species on your list. For plant surveys, we recommend using the enclosed *Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Species*. The results of your surveys should be published in any environmental documents prepared for your project.

State-Listed Species

If a species has been listed as threatened or endangered by the State of California, but not by us nor by the National Marine Fisheries Service, it will appear on your list as a Species of Concern. *However you should contact the California Department of Fish and Game for official information about these species.* Call (916) 322-2493 or write Marketing Manager, California Department of Fish and Game, Natural Diversity Data Base, 1416 Ninth Street, Sacramento, California 95814.

Your Responsibilities Under the Endangered Species Act

All plants and animals identified as *listed* on Enclosure A are fully protected under the Endangered Species Act of 1973, as amended. Section 9 of the Act and its implementing regulations prohibit the *take* of a federally listed wildlife species. Take is defined by the Act as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect" any such animal. Take may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or shelter (50 CFR §17.3).

Take incidental to an otherwise lawful activity may be authorized by one of two procedures:

If a Federal agency is involved with the permitting, funding, or carrying out of a project that may result in take, then that agency must engage in a *formal consultation* with the Service. During formal consultation, the Federal agency, the applicant and the Service work together to avoid or minimize the impact on listed species and their habitat. Such consultation would result in a *biological opinion* by the Service addressing the anticipated effect of the project on listed and proposed species. The opinion may authorize a limited level of incidental take.

If no Federal agency is involved with the project, and federally listed species may be taken as part of the project, then you, the applicant, should apply for an *incidental take permit*. The Service may issue such a permit if you submit a satisfactory conservation plan for the species that would be affected by your project. Should your survey determine that federally listed or proposed species occur in the area and are likely to be affected by the project, we recommend that you work with this office and the California Department of Fish and Game to develop a plan that minimizes the project's direct and indirect impacts to listed species and compensates for project-related loss of habitat. You should include the plan in any environmental documents you file.

Critical Habitat

When a species is listed as endangered or threatened, areas of habitat considered essential to its conservation may be designated as *critical habitat*. These areas may require special management considerations or protection. They provide needed space for growth and normal behavior; food, water, air, light, other nutritional or physiological requirements; cover or shelter; and sites for breeding, reproduction, rearing of offspring, germination or seed dispersal.

Although critical habitat may be designated on private or State lands, activities on these lands are not restricted unless there is Federal involvement in the activities or direct harm to listed wildlife.

If any species has proposed or designated critical habitat within a quad, there will be a separate line for this on the species list. Maps and boundary descriptions of the critical habitat may be found in the *Federal Register*. The information is also reprinted in the *Code of Federal Regulations* (50 CFR 17.95).

Candidate Species

We recommend that you address impacts to *candidate* species. We put plants and animals on our candidate list when we have enough scientific information to eventually propose them for listing as threatened or endangered. By considering these species early in your planning process you may be able to avoid the problems that could develop if one of these candidates was listed before the end of your project.

Your list may contain a section called *Species of Concern*. This term includes former *category 2 candidate species* and other plants and animals of concern to the Service and other Federal, State and private conservation agencies and organizations. Some of these species may become candidate species in the future.

Wetlands

If your project will impact wetlands, riparian habitat, or other jurisdictional waters as defined by section 404 of the Clean Water Act and/or section 10 of the Rivers and Harbors Act, you will need to obtain a permit from the U.S. Army Corps of Engineers. Impacts to wetland habitats require site specific mitigation and monitoring. For questions regarding wetlands, please contact Mark Littlefield of this office at (916) 414-6580.

Updates

Our database is constantly updated as species are proposed, listed and delisted. If you address proposed, candidate and special concern species in your planning, this should not be a problem. We also continually strive to make our information as accurate as possible. Sometimes we learn that a particular species has a different range than we thought. This should not be a problem if you consider the species on the county or surrounding-quad lists that we have enclosed. If you have a long-term project or if your project is delayed, please feel free to contact us about getting a current list. You can also find out the current status of a species by going to the Service's Internet page: www.fws.gov

GUIDELINES FOR CONDUCTING AND REPORTING BOTANICAL INVENTORIES
FOR FEDERALLY LISTED, PROPOSED AND CANDIDATE PLANTS
(September 23, 1996)

These guidelines describe protocols for conducting botanical inventories for federally listed, proposed and candidate plants, and describe minimum standards for reporting results. The Service will use, in part, the information outlined below in determining whether the project under consideration may affect any listed, proposed or candidate plants, and in determining the direct, indirect, and cumulative effects.

Field inventories should be conducted in a manner that will locate listed, proposed, or candidate species (target species) that may be present. The entire project area requires a botanical inventory, except developed agricultural lands. The field investigator(s) should:

1. Conduct inventories at the appropriate times of year when target species are present and identifiable. Inventories will include all potential habitats. Multiple site visits during a field season may be necessary to make observations during the appropriate phenological stage of all target species.
2. If available, use a regional or local reference population to obtain a visual image of the target species and associated habitat(s). If access to reference populations is not available, investigators should study specimens from local herbaria.
3. List every species observed and compile a comprehensive list of vascular plants for the entire project site. Vascular plants need to be identified to a taxonomic level which allows rarity to be determined.
4. Report results of botanical field inventories that include:
 - a. a description of the biological setting, including plant community, topography, soils, potential habitat of target species, and an evaluation of environmental conditions, such as timing or quantity of rainfall, which may influence the performance and expression of target species
 - b. a map of project location showing scale, orientation, project boundaries, parcel size, and map quadrangle name
 - c. survey dates and survey methodology(ies)
 - d. if a reference population is available, provide a written narrative describing the target species reference population(s) used, and date(s) when observations were made
 - e. a comprehensive list of all vascular plants occurring on the project site for each habitat type
 - f. current and historic land uses of the habitat(s) and degree of site alteration
 - g. presence of target species off-site on adjacent parcels, if known

ENCLOSURE A

Endangered and Threatened Species that May Occur in or be Affected by

PROJECTS IN SANTA CLARA COUNTY

Reference File No. 1-1-03-SP-0160

October 28, 2002

Listed Species

Mammals

salt marsh harvest mouse, *Reithrodontomys raviventris* (E)

San Joaquin kit fox, *Vulpes macrotis mutica* (E)

riparian brush rabbit, *Sylvilagus bachmani riparius* (E) *

Birds

California brown pelican, *Pelecanus occidentalis californicus* (E)

California clapper rail, *Rallus longirostris obsoletus* (E)

California least tern, *Sterna antillarum (=albifrons) browni* (E)

Least Bell's vireo, *Vireo bellii pusillus* (E)

marbled murrelet, *Brachyramphus marmoratus* (T)

western snowy plover, *Charadrius alexandrinus nivosus* (T)

bald eagle, *Haliaeetus leucocephalus* (T)

Reptiles

San Francisco garter snake, *Thamnophis sirtalis tetrataenia* (E)

Alameda whipsnake, *Masticophis lateralis euryxanthus* (T)

Critical habitat, Alameda whipsnake, *Masticophis lateralis euryxanthus* (T)

Amphibians

California tiger salamander, *Ambystoma californiense* (C/E)

California red-legged frog, *Rana aurora draytonii* (T)

Critical habitat, California red-legged frog, *Rana aurora draytonii* (T)

Fish

tidewater goby, *Eucyclogobius newberryi* (E)

winter-run chinook salmon, *Oncorhynchus tshawytscha* (E) NMFS

coho salmon - central CA coast, *Oncorhynchus kisutch* (T) NMFS

Central California Coastal steelhead, *Oncorhynchus mykiss* (T) NMFS

South Central California steelhead, *Oncorhynchus mykiss* (T) NMFS

Central Valley spring-run chinook salmon, *Oncorhynchus tshawytscha* (T) NMFS

Sacramento splittail, *Pogonichthys macrolepidotus* (T)

delta smelt, *Hypomesus transpacificus* (T) *

Invertebrates

vernal pool fairy shrimp, *Branchinecta lynchi* (T)

Critical habitat, bay checkerspot butterfly, *Euphydryas editha bayensis* (T)

bay checkerspot butterfly, *Euphydryas editha bayensis* (T)

Plants

Tiburon paintbrush, *Castilleja affinis* ssp. *neglecta* (E)

Coyote ceanothus, *Ceanothus ferrisiae* (E)

Santa Clara Valley dudleya, *Dudleya setchellii* (E)

Metcalf Canyon jewelflower, *Streptanthus albidus* ssp. *albidus* (E)

robust spineflower, *Chorizanthe robusta* var. *robusta* (E) *

Contra Costa goldfields, *Lasthenia conjugens* (E) *

California sea blite, *Suaeda californica* (E) *

showy Indian clover, *Trifolium amoenum* (E) *

Proposed Species

Birds

mountain plover, *Charadrius montanus* (PT)

Candidate Species

Fish

Central Valley fall/late fall-run chinook salmon, *Oncorhynchus tshawytscha* (C) NMFS

Critical habitat, Central Valley fall/late fall-run chinook, *Oncorhynchus tshawytscha* (C) NMFS

Species of Concern

Mammals

Pacific western big-eared bat, *Corynorhinus (=Plecotus) townsendii townsendii* (SC)

greater western mastiff-bat, *Eumops perotis californicus* (SC)

small-footed myotis bat, *Myotis ciliolabrum* (SC)
long-eared myotis bat, *Myotis evotis* (SC)
fringed myotis bat, *Myotis thysanodes* (SC)
long-legged myotis bat, *Myotis volans* (SC)
Yuma myotis bat, *Myotis yumanensis* (SC)
San Francisco dusky-footed woodrat, *Neotoma fuscipes annectens* (SC)
salt marsh vagrant shrew, *Sorex vagrans halicoetes* (SC)

Birds

little willow flycatcher, *Empidonax traillii brewsteri* (CA)
black rail, *Laterallus jamaicensis coturniculus* (CA)
American peregrine falcon, *Falco peregrinus anatum* (D)
tricolored blackbird, *Agelaius tricolor* (SC)
grasshopper sparrow, *Ammodramus savannarum* (SC)
Bell's sage sparrow, *Amphispiza belli belli* (SC)
short-eared owl, *Asio flammeus* (SC)
western burrowing owl, *Athene cunicularia hypugaea* (SC)
American bittern, *Botaurus lentiginosus* (SC)
ferruginous hawk, *Buteo regalis* (SC)
Costa's hummingbird, *Calypte costae* (SC)
Lawrence's goldfinch, *Carduelis lawrencei* (SC)
Vaux's swift, *Chaetura vauxi* (SC)
olive-sided flycatcher, *Contopus cooperi* (SC)
black swift, *Cypseloides niger* (SC)
hermit warbler, *Dendroica occidentalis* (SC)
white-tailed (=black shouldered) kite, *Elanus leucurus* (SC)
common loon, *Gavia immer* (SC)
saltmarsh common yellowthroat, *Geothlypis trichas sinuosa* (SC)
least bittern, western, *Ixobrychus exilis hesperis* (SC)

loggerhead shrike, *Lanius ludovicianus* (SC)
Lewis' woodpecker, *Melanerpes lewis* (SC)
Alameda (South Bay) song sparrow, *Melospiza melodia pusillula* (SC)
long-billed curlew, *Numenius americanus* (SC)
rufous hummingbird, *Selasphorus rufus* (SC)
Allen's hummingbird, *Selasphorus sasin* (SC)
California thrasher, *Toxostoma redivivum* (SC)

Reptiles

silvery legless lizard, *Anniella pulchra pulchra* (SC)
northwestern pond turtle, *Clemmys marmorata marmorata* (SC)
southwestern pond turtle, *Clemmys marmorata pallida* (SC)
San Joaquin coachwhip (=whipsnake), *Masticophis flagellum ruddocki* (SC)
California horned lizard, *Phrynosoma coronatum frontale* (SC)

Amphibians

foothill yellow-legged frog, *Rana boylei* (SC)
western spadefoot toad, *Spea hammondi* (SC)

Fish

green sturgeon, *Acipenser medirostris* (SC)
longfin smelt, *Spirinchus thaleichthys* (SC)

Invertebrates

Opler's longhorn moth, *Adela oplerella* (SC)
Edgewood blind harvestman, *Calicina minor* (SC)
Ricksecker's water scavenger beetle, *Hydrochara rickseckeri* (SC)
California linderiella fairy shrimp, *Linderiella occidentalis* (SC)
Hom's microblind harvestman, *Microcina homi* (SC)
Jung's microblind harvestman, *Microcina juni* (SC)
unsilvered fritillary butterfly, *Speyeria adiaсте adiaсте* (SC)

Plants

Sharsmith's onion, *Allium sharsmithae* (SC)

Mt. Hamilton (=Sharesmith's) harebell, *Campanula sharsmithiae* (SC)

Mt. Hamilton thistle, *Cirsium fontinale* var. *campylon* (SC)

South Bay clarkia (=Santa Clara red ribbons), *Clarkia concinna* ssp. *automixa* (SC)

Mt. Hamilton coreopsis, *Coreopsis hamiltonii* (SC)

clustered lady's-slipper, *Cypripedium fasciculatum* (SC)

interior California (Hospital Canyon) larkspur, *Delphinium californicum* ssp. *interius* (SC)

Brandegee's woolly-star (=eriastrum), *Eriastrum brandegeae* (SC)

Ben Lomond buckwheat (=naked buckwheat), *Eriogonum nudum* var. *decurrens* (SC)

San Francisco wallflower, *Erysimum franciscanum* (SC)

talus fritillary, *Fritillaria falcata* (SC)

fragrant fritillary (= prairie bells), *Fritillaria liliacea* (SC)

Congdon's tarplant, *Hemizonia parryi* ssp. *congdonii* (SC)

Loma Prieta hoita, *Hoita strobilina* (SC)

smooth lessingia, *Lessingia micradenia* var. *glabrata* (SC)

large-flowered (=flower) linanthus, *Linanthus grandiflorus* (SC)

Oregon meconella (=white fairypoppy), *Meconella oregana* (SC)

Gairdner's yampah, *Perideridia gairdneri* ssp. *gairdneri* (SC)

Mt. Diablo phacelia, *Phacelia phacelioides* (SC)

Salinas Valley (=hooked) popcornflower, *Plagiobothrys uncinatus* (SC)

rock sanicle, *Sanicula saxatilis* (SC)

most beautiful (uncommon) jewelflower, *Streptanthus albidus* ssp. *peramoenus* (SC)

water sack (=saline) clover, *Trifolium depauperatum* var. *hydrophilum* (SC)

Franciscan onion, *Allium peninsulare* var. *franciscanum* (SLC)

Santa Cruz manzanita, *Arctostaphylos andersonii* (SLC)

Kings Mountain manzanita, *Arctostaphylos regismontana* (SLC)

big-scale (=California) balsamroot, *Balsamorhiza macrolepis* var. *macrolepis* (SLC)

chaparral harebell (=bellflower), *Campanula exigua* (SLC)

western leatherwood, *Dirca occidentalis* (SLC)

Tiburon buckwheat, *Eriogonum caninum* (SLC)
serpentine bedstraw, *Galium andrewsii* ssp. *gatense* (SLC)
Mt. Hamilton lomatium, *Lomatium observatorium* (SLC)
arcuate bush mallow, *Malacothamnus arcutatus* (=M. *fasciculat*) (SLC)
Hall's bush mallow, *Malacothamnus hallii* (=M. *fasciculatus*) (SLC)
Santa Cruz Mts. beardtongue, *Penstemon rattanii* var. *kleei* (SLC)
maple-leaved checkerbloom, *Sidalcea malachroides* (SLC)
Pacific cordgrass (=California cordgrass), *Sparina foliosa* (SLC)
Mt. Hamilton jewelflower, *Streptanthus callistus* (SLC)
alkali milk-vetch, *Astragalus tener* var. *tener* (SC) *
San Joaquin spearscale (=saltbush), *Atriplex joaquiniana* (SC) *
northcoast (=Point Reyes) bird's-beak, *Cordylanthus maritimus* ssp. *palustris* (SC) *
delta tule-pea, *Lathyrus jepsonii* var. *jepsonii* (SC) *
caper-fruited tropidocarpum, *Tropidocarpum capparideum* (SC) *
hairless allocarya (=popcornflower), *Plagiobothrys glaber* (SC) **
Hoover's button-celery, *Eryngium aristulatum* var. *hooveri* (SC) *
curly-leaved (=curlyleaf) monardella, *Monardella undulata* (SC) *
Greene's popcorn flower, *Plagiobothrys reticulatus* var. *rossianorum* (SC) *
San Francisco Bay spineflower, *Chorizanthe cuspidata* var. *cuspidata* (SC)

KEY:

| | | |
|-------|--------------------------------------|-----------------------------------------------------------------------------------------|
| (E) | <i>Endangered</i> | Listed (in the Federal Register) as being in danger of extinction. |
| (T) | <i>Threatened</i> | Listed as likely to become endangered within the foreseeable future. |
| (P) | <i>Proposed</i> | Officially proposed (in the Federal Register) for listing as endangered or threatened. |
| (PX) | <i>Proposed Critical Habitat</i> | Proposed as an area essential to the conservation of the species. |
| (C) | <i>Candidate</i> | Candidate to become a <i>proposed</i> species. |
| (SC) | <i>Species of Concern</i> | Other species of concern to the Service. |
| (SLC) | <i>Species of Local Concern</i> | Species of local or regional concern or conservation significance. |
| (D) | <i>Delisted</i> | Delisted. Status to be monitored for 5 years. |
| (CA) | <i>State-Listed</i> | Listed as threatened or endangered by the State of California. |

Sacramento, CA 95825

SUBJECT: Request for Special-Status Species List for the Santa Clara Valley Transportation Authority's (VTA) Capitol Expressway Light Rail Transit Project, Santa Clara County

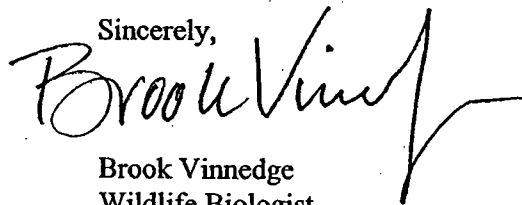

Dear Mr. Mossman:

Jones & Stokes is requesting a list of all species that are listed, proposed for listing, or candidates for listing as threatened or endangered under the Endangered Species Act that could occur within the proposed Capitol Expressway Light Rail Transit project area. The Santa Clara Valley Transportation Authority (VTA) is considering alternatives for improving direct transit service in the corridor containing the alignment of the Capitol Expressway. The alignment of the proposed project generally follows Interstate 680 and U.S. 101 in the City of San Jose. The proposed project corridor is located in the following USGS 7.5-minute topographic quadrangle maps:

- San Jose West
- San Jose East

Please send or fax the requested lists to me at 510.433.8961. Thank you for your prompt attention. If you have any questions or need additional information, please call me at 510.433.8962.

Sincerely,

Brook Vinnedge
Wildlife Biologist

United States Department of the Interior

ENVIRONMENTAL ANALYSIS

2001 SEP 26 P 2:15

IN REPLY REFER TO:
PPN 2878

September 20, 2001

Mr. Thomas Fitzwater
Environmental Planning Manager
Santa Clara Valley Transportation Authority
3331 North First Street
San Jose, California 95134-1906

Dear Mr. Fitzwater:

Thank you for the opportunity to review the Notice of Preparation for a Draft Environmental Impact Report for the Capitol Expressway Light Rail Transit Project in San Jose, California. The enclosures are intended to assist you in the early environmental review of this proposal. Future consultation with the U.S. Fish and Wildlife Service (Service) may be required under the Fish and Wildlife Coordination Act if project activities are anticipated to impact jurisdictional wetlands, and/or the Endangered Species Act if project activities are anticipated to affect federally listed species.

Enclosure A provides a list of sensitive species that may occur in or near the project site. The Service recommends that surveys be completed by a qualified biologist on the proposed project site to confirm the presence or absence of special-status species or their habitats. Enclosure B recommends general guidelines for identifying and mitigating project impacts to fish, wildlife, and their habitats. The Council on Environmental Quality developed regulations for implementing the National Environmental Policy Act, and defines mitigation to include: (1) avoiding the impact; (2) minimizing the impact; (3) rectifying the impact; (4) reducing or eliminating the impact over time; and (5) compensating for impacts. The Service supports and adopts this definition of mitigation and considers the specific elements to represent the desirable sequence of steps in the mitigation planning process. Accordingly, we maintain the best way to mitigate adverse biological impacts is avoidance when at all possible.

We encourage you to use these guidelines to develop a comprehensive environmental document that addresses these needs. If you have any questions regarding these comments, please contact Jerry Bielfeldt in the Wetlands Branch at (916) 414-6584.

Sincerely,

Dale A. Pierce
Acting Field Supervisor

ENCLOSURE B

The goal of the U.S. Fish and Wildlife Service is to conserve, protect and enhance fish, wildlife, and their habitats by timely and effective provision of fish and wildlife information and recommendations. To assist us in accomplishing this goal, we would like to see the items described below discussed in your environmental documents for the proposed project.

Project Description. The document should very clearly state the purposes of, and document the needs for, the proposed project so that the capabilities of the various alternatives to meet the purposes and needs can be readily determined.

A thorough description of all permanent and temporary facilities to be constructed, and all work to be done as a part of the project should be included. The document should identify any associated new access roads, equipment staging areas, and gravel processing facilities. Figures accurately depicting proposed project features in relation to natural features (such as streams, wetlands, riparian areas, and other habitat types) in the project area should be included.

Affected Environment. The document should show the location of, and describe, all vegetative cover types in the areas potentially affected by all project alternatives and associated activities. Tables with acreages of each cover type with and without the project for each alternative would also be appropriate. We recommend that all wetlands in the project area be delineated and described according to the classification system found in the Service's Classification of Wetlands and Deepwater Habitats of the United States (Cowardin 1979). The Service's National Wetland Inventory maps would be one starting point for this effort.

The document should present and analyze a full range of alternatives to the proposed project. At least one alternative should be designed to avoid all impacts to wetlands, including riparian areas. Similarly, within each alternative, measures to minimize or avoid impacts to wetlands should be included.

Lists of fish and wildlife species expected to occur in the project area should be in the document. The lists should also indicate whether or not each species is a resident or migrant, and the period(s) of the year it would be expected in the project area.

Environmental Consequences. The sections on impacts to fish and wildlife should discuss impacts from vegetation removal (both permanent and temporary), filling or degradation of wetlands, interruption of wildlife migration corridors, and disturbance from trucks and other machinery during construction and/or operation. These sections should also analyze possible impacts to streams from construction of outfall structures, pipeline crossings, and filling. Impacts on water quality, including nutrient loading, sedimentation, toxics, biological oxygen demand, and temperature in receiving waters should also be discussed in detail along with the resultant effects on fish and aquatic invertebrates. Discussion of indirect impacts to fish, wildlife, and their habitats, including impacts from growth induced by the proposed project, should also be addressed in the document. The impacts of each alternative should be discussed in sufficient detail to allow comparison between the alternatives.

Because of their very high value to migratory birds, and their ever-increasing scarcity in California, our mitigation goal for wetlands (including riparian and riverine wetlands) is no net loss of in-kind habitat value or acreage (whichever is greater).

In those situations where impacts are unavoidable, adequate mitigation should be provided to offset these impacts. To determine mitigation credits for a given mitigation project, we evaluate the expected future conditions on the mitigation site in the absence of mitigation actions, and then compare those conditions to conditions we expect to develop with implementation of the mitigation plan.

For unavoidable impacts, to determine the mitigation credits available for a given mitigation project, we evaluate what conditions would exist on the mitigation site in the future in the absence of the mitigation actions, and compare those conditions to the conditions we would expect to develop on the site with implementation of the mitigation plan.

Mitigation habitat should be equal to or exceed the quality of the habitat to be affected by the project. Baseline information would need to be gathered at the impact site to be able to quantify this goal in terms of plant species diversity, shrub and tree canopy cover, stems/acre, tree height, etc. The ultimate success of the project should be judged according to these same measurements at the mitigation site.

Criteria should be developed for assessing the progress of the project during its developmental stages as well. Assessment criteria should include rates of plant growth, plant health, and evidence of natural reproduction. Success criteria should be geared toward equaling or exceeding the quality of the highest quality habitat to be affected. In other words, the mitigation effort would be deemed a success in relation to this goal if the mitigation site met or exceeded habitat measurements at a "model" site (plant cover, density, species diversity, etc.).

The plan should present the proposed ground elevations at the mitigation site, along with elevations in the adjacent areas. A comparison of the soils of the proposed mitigation and adjacent areas should also be included in the plan, and a determination made as to the suitability of the soils to support habitats consistent with the mitigation goals.

Because wetland ecosystems are driven by suitable hydrological conditions, additional information must be developed on the predicted hydrology of the mitigation site. The plan should describe the depth of the water table, and the frequency, duration, areal extent, and depth of flooding which would occur on the site. The hydrologic information should include an analysis of extreme conditions (drought, flooding) as well as typical conditions.

The plan must include a timeframe for implementing the mitigation in relation to the proposed project. We recommend that mitigation be initiated prior to the onset of construction. If there will be a substantial time lag between project construction and completion of the mitigation, a net loss of habitat values would result, and more mitigation would be required to offset this loss.

In response refer to:
July 1, 2003 151422SWR03SR8717:MEM

Jeff Kozlowski
Fisheries Biologist
Jones & Stokes
2600 V Street
Sacramento, California 95818-1914

Dear Mr. Kozlowski:

Thank you for your letter of June 9, 2003, regarding the presence of Federally listed (or proposed for listing) threatened or endangered species or critical habitat under the jurisdiction of the National Marine Fisheries Service (NOAA Fisheries) that may be affected by the Santa Clara Valley Transportation Authority's (VTA) proposed Capitol Expressway corridor light rail transit extension. The extension would require modifications to bridges crossing the following creeks in the Santa Clara Basin: Canoas Creek, a tributary of the Guadalupe River; Silver Creek and its tributary Thompson Creek; and Coyote Creek.

Endangered Species Act

Canoas, Silver, and Thompson Creeks are highly modified flood control channels. NOAA Fisheries has determined that listed species are unlikely to be present in these creeks. Typical conditions such as denuded banks, low flows, and high water temperatures in these channels act to limit or preclude salmonid presence. As a result, salmonids are not likely to be adversely affected at these locations. Available information indicates that the following listed species (Evolutionarily Significant Units) and designated critical habitat may occur in the project area on Coyote Creek:

Central California Coast steelhead (*Oncorhynchus mykiss*)
threatened (August 18, 1997, 62 FR 43937)

The U.S. Fish and Wildlife Service (USFWS) may also have listed species or critical habitat under its jurisdiction in the project area. Please contact Mr. Harry Mossman at USFWS, 2800 Cottage Way, W-2605, Sacramento, California 95825 or (916) 414-6600 regarding the presence of listed species or critical habitat under USFWS jurisdiction that might be affected by your project.

Magnuson-Stevens Act - Essential Fish Habitat

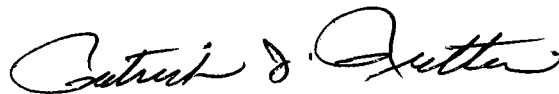

The Coyote Creek project site is located within an area identified as Essential Fish Habitat (EFH) for various life stages of fish species managed with the following Fishery Management Plans (FMP) under the Magnuson-Stevens Fishery Conservation and Management Act (MSFCMA):

Pacific Coast Salmon FMP - (Chinook and coho salmon)

Amendments to the MSFCMA in 1996 require Federal agencies to consult with NOAA Fisheries regarding any action or proposed action that may adversely affect EFH for Federally-managed fish species. For more information on EFH, see our website at "<http://swr.nmfs.noaa.gov>". Please send an EFH assessment to NOAA Fisheries if the NPS determines that the proposed action may adversely affect EFH for any species in the FMPs listed above.

If you have questions concerning these comments, please contact Maura Eagan Moody at (707) 575-6092 or by email at maura.e.moody@noaa.gov.

Sincerely,

Patrick J. Rutten
Northern California Supervisor
Protected Resources Division

Appendix E-5

**Biological Resources Survey
Technical Memorandum**

Jones & Stokes

Memorandum

Date: March 6, 2003

To: Debra Jones, Project Manager

cc: Seema Sairam, Project Coordinator

From: Marcia Semenoff-Irving, Project Biologist
Brook Vinnedge, Project Biologist

Subject: **Summary of reconnaissance survey conducted in the VTA Capitol Expressway Corridor study area**

Jones & Stokes biologists Marcia Semenoff-Irving and Brook Vinnedge conducted a reconnaissance-level survey of the VTA Capitol Expressway project area to determine potential for the proposed project to impact sensitive resources. This survey supported the initial survey conducted by Jones & Stokes biologists Shannon Bane and Keith Casey on October 16, 2001. The following is a summary of the methods and results of these surveys.

Pre-field Investigation

Prior to the field visit biologists reviewed information about special status species and habitats that could occur in the project vicinity. During the pre-field investigation, Jones & Stokes biologists conducted a records search of the California Natural Diversity Data Base (2002) and California Native Plant Society's Inventory of Rare and Endangered Plants in California for the 7.5-minute San Jose East, Milpitas, Calaveras Reservoir and San Jose West USGS 7.5-minute quadrangles to determine whether any special-status species were known to occur in the project vicinity. Based on the pre-field investigation, contacts with agency personnel, and knowledge of the project area, target species lists were created that summarize the status, distribution, habitats, and potential for occurrence of special-status plant and wildlife species in the area.

Survey Methods

Biologists conducted reconnaissance surveys of the general project area on October 16, 2001 and November 21, 2002. The purpose of the surveys was to collect information on the habitats present along the project route, to document the presence of wetlands (unverified) and streams, and to evaluate the potential for occurrence of special-status plants and wildlife species. During the surveys, biologists visually inspected the project area from a moving vehicle, with occasional stops to more closely inspect important features, including riparian habitats, drainages, and vacant lots. Habitat features were noted on an aerial photograph of the study area

Survey Results

The project area contains 5 vegetation communities (habitat types). These vegetation communities include: Central Coast cottonwood-sycamore riparian forest, freshwater marsh, ruderal, and aquatic habitats and potential (unverified) waters of the United States. Potential habitat for special status bats and raptors occurs at the Coyote Creek crossing. In addition, this creek may provide marginal dispersal habitat for the federally listed California red-legged frog and special status fish such as steelhead trout and chinook salmon. Potential habitat for the Western burrowing owl occurs throughout the project area. Focused surveys for these species are recommended.

Conclusions

Biologists recommend that focused surveys be conducted to determine the extent of the impact the proposed project may have on special status species. The recommended focused surveys include a preconstruction survey for nesting raptors (during the nesting season only), a preconstruction survey for burrowing owls (year-round), a survey for special status bat species at the coyote creek crossing, and special status fish surveys prior to construction. Analysis of impacts at coyote creek will determine whether or not protocol level surveys should be conducted for California red-legged frog.

Appendix E-6

**Relevant Plans and Policies for
Biological Resources**

Definition of Special-Status Species

Special-status species include plants and animals that are legally protected under state and federal Endangered Species Acts (ESAs) or other regulations (described below), as well as species considered sufficiently rare by the scientific community to qualify for such listing. Special-status species include the following categories of plants and animals:

- plants and animals listed or proposed for listing as threatened or endangered under the federal ESA and/or California Endangered Species Act (CESA);
- plants and animals that are candidates for possible future listing as threatened or endangered under the federal ESA and/or CESA;
- b/plants listed under the California Native Plant Protection Act (CNPPA);
- plants that meet the definition of rare or endangered under the California Environmental Quality Act (CEQA), including those considered by the California Native Plant Society (CNPS) to be rare, threatened, or endangered in California;
- animal species of special concern to the California Department of Fish and Game (CDFG); and
- animals fully protected in California.

Federal Regulations

Endangered Species Act

The federal ESA protects fish and wildlife species listed as threatened or endangered, as well as their habitats. Endangered species, subspecies, or distinct population segments are those in danger of extinction through all or a significant portion of their range; threatened species, subspecies, or distinct population segments are likely to become endangered in the near future. The U.S. Fish and Wildlife Service (USFWS) (with jurisdiction over plants, wildlife, and resident fish) and National Oceanic and Atmospheric Administration (NOAA) Fisheries (with jurisdiction over anadromous fish and marine fish and mammals) administers the ESA.

Section 7

ESA Section 7 requires federal agencies consult with USFWS and NOAA Fisheries to ensure that their actions do not jeopardize the continued existence of a listed fish or wildlife species, or destroy or adversely modify that species' critical habitat as defined and designated by federal regulations. Under Section 7, federal agencies are also prohibited from jeopardizing the continued existence

of any federally listed plant species in issuing any permit. For a proposed action to comply with Section 7, a biological assessment is typically prepared to document the action's expected impacts and proposed mitigation to compensate for those impacts.

Section 9

ESA Section 9 prohibits the take of any fish or wildlife species listed as endangered. Take of threatened species is also prohibited unless otherwise authorized by federal regulations. Take, as defined by the ESA, means "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." Harm is defined as "any act that kills or injures the species, including significant habitat modification." Section 9 also prohibits removing, digging up, cutting, maliciously damaging, or destroying federally listed plants on sites under federal jurisdiction.

Migratory Bird Treaty Act

The federal Migratory Bird Treaty Act (MBTA), administered by USFWS, implements a series of treaties between the United States, Mexico, and Canada that provide for the international protection of migratory birds. The law contains no requirement to prove intent to violate any of its provisions. Wording in the MBTA makes it clear that most actions that result in "taking" or possession (permanent or temporary) of a protected species can be a violation of the act. The word take is defined as meaning "pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to pursue, hunt, shoot, wound, kill, trap, capture, or collect." The provisions of the MBTA are nearly absolute; "except as permitted by regulations" is the only exception. Examples of permitted actions that do not violate the law are the possession of a hunting license to pursue specific gamebirds, legitimate research activities, display in zoological gardens, bird-banding, and similar activities.

Bald and Golden Eagle Protection Act

Bald eagle protection began in 1940 with the passage of the Eagle Protection Act, which was later amended to include golden eagle and was renamed. The Bald and Golden Eagle Protection Act makes it unlawful to import, export, take, sell, purchase, or barter any bald eagle or golden eagle, their parts, products, nests, or eggs. Take includes pursuing, shooting, poisoning, wounding, killing, capturing, trapping, collecting, molesting, or disturbing. Exceptions may be granted by USFWS for scientific or exhibition use, or for traditional and cultural use by Native Americans. However, no permits may be issued for import, export, or commercial activities involving eagles.

Clean Water Act

The federal Clean Water Act (CWA) is an amendment to the Federal Water Pollution Control Act of 1972, which outlined the basic structure for regulating discharges of pollutants to waters of the United States. Several sections of this act pertain to regulating impacts to wetlands. The discharge of dredged or fill material into waters of the United States is subject to permitting under Section 404. Section 401 specifies additional requirements for permit review, particularly at the state level. The CWA is administered by the U.S. Environmental Protection Agency (EPA) and U.S. Army Corps of Engineers (Corps).

Section 401

CWA Section 401 gives individual states the authority to issue, waive, or deny certification that a proposed activity is in conformance with state water quality standards. Projects, including those that require permits from the Corps under Section 404 are reviewed by the state's Regional Water Quality Control Boards (RWQCBs). The Capitol Expressway Corridor is under the jurisdiction of the San Francisco Bay RWQCB .

Section 404

The Corps and EPA regulate the placement of fill and dredged materials into waters of the United States under CWA Section 404. Waters of the United States include lakes, rivers, streams, and their tributaries, as well as wetlands. Tributary waters subject to Corps jurisdiction extend to the ordinary high water mark on opposing channel banks. Wetlands are defined for regulatory purposes as areas "inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions." Project proponents must obtain a permit from the Corps for all discharges of dredged or fill material into waters of the United States, including wetlands, before proceeding with a proposed action.

The Corps may either issue individual permits on a case-by-case basis or general permits at a program level. General permits are pre-authorized and are issued to cover similar activities expected to cause only minimal adverse environmental effects. Nationwide permits (NWP) are a type of general permit issued to cover particular fill activities. NWPs have a set of conditions that must be met for the permits to apply to a particular project and specific conditions that apply to each NWP.

State Regulations

California Endangered Species Act

CESA protects wildlife and plants listed as threatened and endangered by the California Fish and Game Commission. The act is administered by CDFG. CESA requires state agencies to conserve threatened and endangered species (California Fish and Game Code Section 2055), and thus restricts all persons from taking listed species except under certain circumstances. The CESA defines take as any action or attempt to “hunt, pursue, catch, capture, or kill.” CDFG may authorize take under California Fish and Game Code Section 2081 agreements, except for designated “fully protected species.” The requirements for an application for an incidental take permit under CESA are described in California Fish and Game Code Section 2081 and in final adopted regulations for implementing Sections 2080 and 2081.

California Native Plant Protection Act

The CNPPA prohibits importation of rare and endangered plants into California, take of rare and endangered plants, and sale of rare and endangered plants. CESA defers to the CNPPA, which ensures that state-listed plant species are protected when state agencies are involved in projects subject to CEQA. In this case, plants listed as rare under the CNPPA are not protected under CESA, but rather under CEQA. The following activities are exempt from the CNPPA:

- agricultural operations;
- fire control measures;
- timber harvest operations;
- mining assessment work;
- removal of plants by private landowners on private land for construction of canals, ditches, buildings, roads, or other rights-of-way; and
- removal of plants for performance of a public service by a public agency or a publicly or privately owned public utility.

California Fish and Game Code

The California Fish and Game Code (14 California Code of Regulations 1600–1607) provides protection from take for a variety of species. Section 5050 lists protected amphibians and reptiles. Eggs and nests of all birds are protected under Section 3503, nesting birds (including raptors and passerines) under Sections 3503.5 and 3513, birds of prey under Section 3503.5, and fully protected birds

under Section 3511. All birds that occur naturally in California and are not resident game birds, migratory game birds, or fully protected birds are considered non-game birds and are protected under Section 3800. Mammals are protected under Section 4700. Hawks, falcons, and owls that occur in the Capitol Expressway Corridor are thus protected under Section 3503.5 and non-game birds under Section 3800.

Section 1601 (or 1603 for private entities) requires that state or local government agencies notify CDFG and obtain a streambed alteration agreement before they begin any construction project that will:

- divert, obstruct, or change the natural flow or the bed, channel, or bank of any river, stream, or lake;
- use materials from a streambed; or
- result in the disposal or disposition of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into any river, stream, or lake.

In general, CDFG jurisdiction extends to the top of the stream or bank, or to the outer edge of riparian vegetation, whichever is wider.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act, passed in 1975, provides State coordination with the CWA, which is described above. It provides a mechanism by which the RWQCBs certify federally-issued CWA permits to ensure the compatibility of federal and state water quality guidelines. The act provides for the development and periodic review of water quality control plans (basin plans) that designate beneficial uses of California's major rivers and groundwater basins and establish narrative and numerical water quality objectives for those waters. Basin plans are primarily implemented by using the National Pollution Discharge Elimination System permitting system to regulate waste discharges to ensure that water quality objectives are met.

Local Regulations

City of San Jose Heritage Tree Ordinance

The City of San Jose (City) heritage tree ordinance is designed to protect trees to provide aesthetic beauty, economic vitality, and environmental stability for city lands. Protected trees are identified in Resolution No. 69745, dated June 27, 2000. The ordinance requires that project proponents take into account the location of all heritage trees on a property when new building or outdoor space is

planned. Development plans must preserve and minimize disturbance to as many trees as possible. Heritage trees can only be removed if approved by the City Council, and must be mitigated by planting replacement trees at a ratio determined at the time of approval. In addition to heritage trees, the removal of any tree with a circumference of 56 inches or more at the height of 24 inches above natural grade slope must be approved by the Planning Department via a tree removal permit.

City of San Jose Riparian Corridor Policy Study

In May 1994, the City Council adopted the riparian corridor policy study (RCPS) to guide the City's treatment of riparian corridors and protect biotic resource values when development occurs along creek systems. Riparian habitats are recognized as important natural resources because they support a great variety and abundance of aquatic and terrestrial species. Provisions of the adopted RCPS have been incorporated into the San Jose 2020 General Plan natural resource policies. These policy guidelines are being used in the development review process resulting in 50- to 100-foot setbacks from riparian corridors for new development as well as other techniques to protect water quality and fish and wildlife habitat.

APPENDIX A

AS-BUILT LOGS OF TEST BORINGS

**GEOTECHNICAL IMPACT REPORT
CAPITOL EXPRESSWAY LIGHT RAIL TRANSIT PROJECT
SAN JOSE, CALIFORNIA**

1. INTRODUCTION

The purpose of this report is to provide an evaluation of potential geotechnical impacts on the project, reasonable mitigation measures, and whether these mitigation measures can reduce the potential impacts to acceptable levels. Specifically, this report addresses the geotechnical and seismic impacts of the proposed project.

This report is based on research of available published and unpublished geological/geotechnical data and review of subsurface information in our files and elsewhere. No new borings were made for this study.

2. PROPOSED PROJECT

The proposed project consists of an 8.2 mile-long (13.2 km) light rail alignment extension along Capitol Expressway from the terminus of the Capitol Avenue LRT Line at the Alum Rock Station to the Eastridge Transit Center and connect with the existing Guadalupe LRT Line at SR 87. The new Capitol Expressway Corridor would have 9 stations, located near Story Road, Ocala/Cunningham Avenue, Eastridge Mall, Nieman Boulevard, McLaughlin Avenue, Senter Road, Monterey Highway, Vistapark Drive and Highway 87. The alternative includes a potential future station at Silver Creek Road. The proposed project alignment is presented on Plate 1, "Project Location Plan."

The proposed project alignment would operate primarily in the median of Capitol Expressway including grade-separation and at-grade intersection crossings. However, some short alignment sections and options would deviate from the median.

i. From Alum Rock Station to Story Road

The light rail alignment would begin at the existing Alum Rock Station on the Capitol Avenue LRT Line. In this segment, the alignment could be constructed in the median of

Jones & Stokes Associates

Job No. 201162.10 (Capitol Expressway Light Rail Transit Project)

March 31, 2003 (Revised October 2004)

Page 2

Capitol Expressway from the Alum Rock station until just north of Story Road. The light rail alignment would be constructed at-grade for most of its course along Capitol Expressway. However, in this section of the corridor, an aerial guideway would be constructed for the full distance from south of Alum Rock Station to south of Story Road. The guideway would be located in the median of Capitol Avenue and Capitol Expressway and would be approximately 4,000 feet long. At its northern end, the aerial structure would cross the northbound lanes of Capitol Avenue and Capitol Expressway and transition to an alignment in the median of Capitol Expressway. The light rail alignment would continue on the aerial structure over Story Road and resume a ground-level profile south of Story Road.

Two vertical profile options are under consideration. Both options include two bus bays on Story Road (east of Capitol Expressway) and a kiss-and-ride lot on the southeast corner of the intersection.

- **Capitol Avenue/Capitol Expressway Tunnel/Story Road Aerial Option:** Under this option, a 1,330-foot-long tunnel would be constructed from south of Alum Rock Station, under the intersection of Capitol Expressway and Capitol Avenue and the northbound lanes of Capitol Expressway, to a point 20 feet north of Silver Creek. At this point, the alignment would leave the tunnel and transition to a 2,600-foot-long aerial structure that would cross Story Road. The aerial structure would continue south past Story Road, where it would transition back to ground level. Both the tunnel and the aerial structure would be located in the median of Capitol Avenue and Capitol Expressway.
- **Capitol Avenue/Capitol Expressway/Story Road Tunnel Option:** A 3,950-foot tunnel would be constructed from north of Capitol Avenue/Capitol Expressway to south of Story Road. It would be constructed in the median. The tunnel would pass under Capitol Avenue/Capitol Expressway intersection, cross under Silver Creek and Story Road before returning to a ground-level profile 1,225 feet south of Story Road. The tunnel option would include a depressed, open-air station at Story Road.

ii. From Story Road to Eastridge Transit Center

From south of Story Road, the alignment would be at-grade through the Ocala and Cunningham Avenue intersections. Before reaching Tully Road, a tunnel would provide a grade-separated transition from the median-running configuration along Capitol Expressway to the side-running configuration of the new station at Eastridge Transit Center. The Tully Road tunnel would measure approximately 2,150 feet. In addition to removing light rail operations from the congested intersection of Tully Road, the grade separations in this area would serve to transition the light rail alignment between median- and side-running operations. One alignment and station option is being considered.

- **North of Eastridge Transit Center Aerial Crossing with Aerial Station Option:** An aerial guideway would be constructed to transition the alignment from median-running north of Tully Road to side-running south of Tully Road in the Eastridge Transit Center. The proposed station at the Eastridge Transit Center would be located on the aerial guideway.

iii. From Eastridge Transit Center to Aborn Road

South of the at-grade Eastridge Transit Center, the alignment would enter a retained cut section that would drop the tracks onto a tunnel structure carrying the light rail under the southbound Capitol Expressway lanes and Quimby Road. From that point, it would return to grade through another retained cut section in the median south of Quimby Road and remain at-grade until it reaches Aborn Road. The following four vertical alignment options are under consideration between the Eastridge Transit Center and Aborn Road.

- **South of Eastridge Transit Center Aerial Crossing Option (Only with Eastridge Aerial Station Option):** If the alignment comes into the Eastridge Transit Center on an aerial structure, it would remain on an aerial structure as it continues south across the southbound Capitol Expressway lanes and Quimby Road, where it would return to grade through another retained fill section in the median south of Quimby Road and remain at-grade to the vicinity of Aborn Road.

- **South of Eastridge Transit Center Side-Running/Tunnel at Nieman Boulevard Option:** South of the Eastridge Transit Center, the alignment would continue as side-running until the Nieman Station on the west side of the Capitol Expressway north of Nieman Boulevard, where it would transition back to the median via a cut section that would drop the tracks onto a tunnel structure under southbound Capitol Expressway. From that point, it would return to grade through another retained cut section in the median south of Nieman Boulevard and remain at-grade to the vicinity of Aborn Road.
- **South of Eastridge Transit Center Side-Running/Trench Option:** South of Eastridge Transit Center, the alignment would enter a retained cut section that would drop the tracks onto a trench structure carrying the light rail under the Eastridge Loop Road and Quimby Road, where it would return to grade through another retained cut section south of Quimby Road continuing at-grade through the Nieman Station. At this point, it would enter a retained cut section that would drop the tracks into a tunnel structure carrying the light rail under the southbound Capitol Expressway lanes, where it would return to grade through another retained cut section in the median south of Nieman Boulevard and remain at-grade to the vicinity of Aborn Road.
- **South of Eastridge Transit Center Side-Running At-Grade/Aerial Option:** South of the Eastridge Transit Center, the alignment would continue as at-grade, side-running until the Nieman Boulevard Station on the west side of Capitol Expressway north of Nieman Boulevard.

iv. *From Aborn Road to Silver Creek Road*

The alignment would cross Aborn Road at grade and Silver Creek Road via an aerial structure. The length of the aerial structure from the beginning of the first retained fill section to the end of the last retained fill section would be approximately 2,800 feet. There are two design options at Nieman Boulevard/Aborn Road. Each of these options would transition to an aerial structure for the alignment to cross Silver Creek Road.

- **Aerial Crossing at Aborn Road Option:** An aerial guideway would be constructed in the median from before the Aborn Road intersection through the Silver Creek Road intersection. The total length of the structure would be 8,000 feet.

- **Aerial Crossing at Aborn Road Option (Only with Side-Running Options):** If the aerial option at Aborn Road is from the side-running segment to the median, the aerial guideway would begin before Nieman Boulevard and continue through both Aborn Road and the Silver Creek intersection. The total length of the structure would be 9,500 feet.

v. *From Silver Creek Road to Coyote Creek*

The alignment would continue on the aerial structure through the potential future Silver Creek Station and transition back to the level of Capitol Expressway through another retained fill section just before the Capitol Expressway overpass of U.S. 101, then continue in the median of Capitol Expressway over U.S. 101 through McLaughlin Road to Coyote Creek. One design option is under consideration for the section between Silver Creek Road and Coyote Creek.

- **Aerial Crossing of U.S. Highway 101 Option:** The alignment would remain elevated through the optional future Silver Creek Station, as described above. However, in this option, the alignment would continue on a separate aerial structure across southbound Capitol Expressway on the north side of the overpass crossing of U.S. 101. After crossing U.S. 101, the alignment would proceed across the southbound Capitol Expressway lanes over McLaughlin Avenue, through the proposed McLaughlin Avenue Station, and transition back to grade level through another retained fill section just before Coyote Creek.

vi. *From Coyote Creek to Highway 87*

The alignment would proceed in the median of Capitol Expressway for the entire length of the section between Coyote Creek and the end of the alignment near SR 87.

Several sites exist along Capitol Expressway for park-and-ride facilities. Three existing park-and-ride lots are located along the alignment: Alum Rock Station, Eastridge Transit Center, and Capitol Station (at SR 87). A fourth park-and-ride lot within the corridor is

Jones & Stokes Associates

Job No. 201162.10 (Capitol Expressway Light Rail Transit Project)

March 31, 2003 (Revised October 2004)

Page 6

located at the intersection of Monterey Highway and Fehren Drive. This facility serves the Caltrain Capitol station, which lies approximately 2,000 feet north of Capitol Expressway. To serve the Light Rail Alternative, two additional facilities are needed, including an expanded park-and-ride facility at the Eastridge Transit Center, and a site on the southwest corner of Ocala Avenue and Capitol Expressway to serve the Ocala Station.

In addition, the Light Rail Alternative would include options for two new park-and-ride facilities to meet the forecasted demand:

- **Expanded Eastridge Transit Center Park-and-Ride Option (Only if No Ocala Avenue Station Park-and-Ride):** If there is no park-and-ride at the Ocala Avenue Station, then the Eastridge Transit Center Park-and-Ride would need to be expanded to accommodate the demand.
- **Monterey Highway Station Park-and-Ride Options:** To serve the relocated Capitol Caltrain Station and the proposed Monterey Highway Station, three park-and-ride options with a bus transfer center are under consideration.
 - **Monterey Highway Cloverleaf Option:** Located in the center of the cloverleaf ramps on the east side of Monterey Highway both north and south of Capitol Expressway.
 - **Northwest of Monterey Highway Station Option:** This option would locate the park-and-ride facility at a site to the northwest of the Monterey Highway Station.
 - **Northeast of Monterey Highway Station Option:** This option would locate the park-and-ride facility at a site to the northeast of the Monterey Highway Station and north of the cloverleaf ramps at Capitol Expressway.

3. SETTING AND EXISTING CONDITIONS

3.1. Regional Geology

The alignment of the proposed project is located near the southeastern edge of the San Francisco Bay. The San Francisco Bay area is located within the Coast Range Geomorphic Province of California, a region shaped by complex and dynamic geologic

processes. Deformation of the earth's crust has resulted from the interaction of mobile crustal plates ("tectonics"). Faulting, folding and erosion have produced the northwest-trending ridges and valleys, which characterize the Coast Ranges. The San Francisco Bay occupies a structural depression, which was formed between the uplifted Diablo Range and Berkeley Hills (along the east side of the depression) and the hills of the San Francisco Peninsula (along the west side of the downdropped block). The structural depression has been partially filled in with sediment and inundated by seawater to form the San Francisco Bay.

The dominant structural feature within the region is the San Andreas Fault System. This system includes several major fault zones, including the San Andreas, Hayward, and Calaveras fault zones. The San Andreas Fault System is the seismically active crustal boundary along which northwestward movement of the Pacific plate west of the fault is taking place relative to the North American plate (located east of the fault).

3.2. Local Geology

General geologic features pertaining to the site were evaluated by reference to the Preliminary Geologic Map of the San Jose 30 X 60-Minute Quadrangle, California (Carl M. Wentworth, M. Clark Blake, Robert J. McLaughlin, and Russell W. Graymer, 1999). Based on the map, the project site soils mainly consist of Holocene Basin Deposits (Qhb), Holocene Levee Deposits (Qhl) and Upper Pleistocene Alluvial Fan Deposits (Qpf). A geologic map of the general project area is shown on Plate 2. Descriptions of the main geologic units are as follows:

- Qhb - Basin Deposits (Holocene) - dark-colored clay and very fine silty clay, rich in organic material.

- Qhl - Levee Deposits (Holocene) - sandy and clayey silt ranging to sandy and silty clay, loose and moderately to well sorted, coarser along Coyote Creek than along the smaller streams, generally well drained.

Jones & Stokes Associates

Job No. 201162.10 (Capitol Expressway Light Rail Transit Project)

March 31, 2003 (Revised October 2004)

Page 8

- Qpf - Alluvial Fan Deposits (Upper Pleistocene) - tan to reddish brown gravel, clast supported, clasts typically cobble sized, clayey and sandy matrix, crudely bedded.
- Qht - Stream Terrace Deposits (Holocene) – Terrace deposits include sand, gravel, silt and minor clay, and are moderately to well sorted, and moderately to well bedded. Liquefaction susceptibility is high because of the presence of loose, granular deposits and shallow ground water. Should liquefaction occur, the presence of a free face and laterally extensive point bar deposits makes lateral spreading likely.
- Qhf₂ - Old Alluvial Fan Deposits (Holocene) - brown gravelly sand and sandy/clayey gravel, grading upward to sandy and silty clay, moderately dense to dense, coarser near the fan heads and upstream, deposited by flooding streams where they emerge from constrained channels of the uplands.

4. SEISMICITY

The project is located in a seismically active part of northern California. Many faults exist in the San Francisco Bay Area, which are capable of producing earthquakes, and they may cause strong ground shaking at the site. The attached Fault Map (Plate 3) presents the locations of the fault systems relative to the project site.

Maximum credible earthquake magnitudes for some of the major faults in the area determined by Mualchin (California Seismic Hazard Map 1996) are summarized below. These maximum credible earthquake magnitudes represent the largest earthquakes that could occur on the given fault based on the current understanding of the regional tectonic structure.

Jones & Stokes Associates

Job No. 201162.10 (Capitol Expressway Light Rail Transit Project)

March 31, 2003 (Revised October 2004)

Page 9

| Fault | Estimated Closest Distance to Fault from Project Area | Maximum Credible Earthquake |
|---------------------------------------------|--------------------------------------------------------------|------------------------------------|
| San Andreas/North (strike-slip) | 24.6 km | 8.0 |
| Hayward (strike-slip) | 4.2 km | 7.5 |
| Monte Vista/East (Unknown/not published) | 10.7 km | 6.5 |
| Calaveras-Pacines-San Benito (strike-slip) | 8.4 km | 7.5 |

Based on the seismic hazard map prepared by Mualchin (1996) and the attenuation relationship by Sadigh et Al. (1997) the controlling fault is the Hayward Fault (Mw = 7.5), and a peak bedrock acceleration of 0.6 g is anticipated at the site.

The Seismic Hazard Map by Mualchin (1996) was used in order to estimate the closest distance of the proposed project site from the faults. In addition, the Maximum Credible Earthquake (MCE) values were based on the same reference. The attenuation relationship by Sadigh, et. al. (1997) was used in order to estimate the Peak Bedrock Acceleration (PBA) for each fault. This relation uses as input the distance and the earthquake magnitude which were both based on the Hazard Map by Mualchin (1996), as described. There was no multiple usage of attenuation relationships. The data are summarized in the following table:

| Fault | Estimated Closest Distance to Fault from Project Area | Maximum Credible Earthquake (MCE) | Peak Bedrock Acceleration (PBA) | Peak Ground Acceleration (PGA) |
|---------------------------------------------|--------------------------------------------------------------|------------------------------------------|----------------------------------------|---------------------------------------|
| San Andreas/North (strike/slip) | 24.6 km | 8.0 | 0.30 g | 0.36 g |
| Hayward (strike/slip) | 4.2 km | 7.5 | 0.60 g | 0.60 g |
| Monte Vista/East (Unknown/not published) | 10.7 km | 6.5 | 0.30 g | 0.36 g |
| Calaveras-Pacines-San Benito (strike/slip) | 8.4 km | 7.5 | 0.50 g | 0.50 g |

Jones & Stokes Associates

Job No. 201162.10 (Capitol Expressway Light Rail Transit Project)

March 31, 2003 (Revised October 2004)

Page 10

The Peak Ground Acceleration (PGA) was based on Caltrans SDC (Version 1.2, December 2001) and the assumption that the soil meets the criteria for Soil Profile D (based on the as-built soil information. This is tabulated in the table above. The most critical Peak Ground Acceleration (PGA) dictated the controlling fault. In this case, the controlling fault is the Hayward Fault, where $PGA = 0.6 g$.

Potential seismic hazards may arise from three sources: surface fault rupture, ground shaking, and liquefaction. Since no active faults pass through the site, the potential for fault rupture is relatively low. Based on available geological and seismic data, the possibility of the site to experience strong ground shaking may be considered moderate to high.

Liquefaction is a phenomenon in which saturated cohesionless soils are subject to a temporary but essentially total loss of shear strength under the reversing, cyclic shear stresses associated with earthquake shaking. Submerged cohesionless sands and silts of low relative density are the type of soils, which usually are susceptible to liquefaction. Clays are generally not susceptible to liquefaction. Based on the Preliminary Map of Quaternary Deposits and Liquefaction Susceptibility, Nine-County San Francisco Bay Region, California, by K. L. Knudsen, J. M. Sowers, R. C. Witter, C. M. Wentworth and E. L. Helley, U.S.G.S. Open File Report 00-444 (Fig. 4), the liquefaction potential generally ranges from moderate to high. The liquefaction potential at specific structure locations should be further addressed during the design phase.

5. SUBSURFACE CONDITIONS

Published and unpublished geotechnical exploration data along the proposed alignment were reviewed in order to obtain a general idea of the subsurface conditions underlying the project site.

According to the Log of Test Borings for Lower Silver Creek, Reach 4 (reference No. 5), the native soils at the vicinity of Capitol Expressway over Silver Creek in the upper 30 feet (explored depth) consist of predominantly firm to very stiff sandy lean clay, lean clay and fat clay, underlain by a layer of medium dense to dense clayey sand with gravel.

Jones & Stokes Associates

Job No. 201162.10 (Capitol Expressway Light Rail Transit Project)

March 31, 2003 (Revised October 2004)

Page 11

The clay layer becomes thinner towards the east side of Capitol Expressway. Groundwater was encountered at a depth of approximately 10 to 15 feet.

According to the Log of Test Borings for the Vehicular and Pedestrian Bridges over Silver Creek, near "Raging Waters" site at Lake Cunningham Park (reference No. 6), the native soil around the intersection of Capitol Expressway and Tully Road area in the upper 90 feet (explored depth) consist of predominantly firm to very stiff lean clay/fat clay, interbedded with lenses of loose to medium dense clayey sand/silty sand with occasional gravel. In addition, based on other borings drilled for Reid-Hill View Airport (west of Capitol Expressway), shallow groundwater table was encountered, at a depth of approximately three to five feet (reference No. 10).

The as-built Log of Test Borings for Capitol Expressway Overcrossing Route 101 (Bridge No. 37-0218, reference No. 7) by Caltrans, dated 1975 and 1962 were reviewed. Based on the above reference, the site is underlain by approximately 50 feet of firm to stiff lean clay/silty clay/sandy lean clay, interbedded with a layer of 7 to 10 feet of loose to medium dense silty sand. Underneath this layer, dense sand and gravel were encountered to the maximum explored depth of 60 to 65 feet below ground surface. These plans contain no information regarding groundwater elevation.

The as-built Log of Test Borings for Capitol Expressway Overcrossing Monterey Road (Bridge No. 37-0101, Hillsdale Capitol Overhead, reference No. 8) by Caltrans, dated 1996 were reviewed. Based on the above reference, the site is underlain by up to 35 feet of loose silty sand/sandy silt. Underneath this layer, medium dense to dense silty sand, sand and gravelly sand were encountered to the maximum explored depth of 75 feet below ground surface. These plans contain no information regarding groundwater elevation.

The as-built Log of Test Borings for Capitol Expressway Undercrossing Route 87 (Guadalupe Corridor, Bridge No. 37-0415R/L, reference No. 9) by Caltrans, dated 1992 and 1993 were reviewed. Based on the above reference, the site is underlain by approximately 50 to 60 feet of firm to very stiff lean clay/silty clay/sandy lean clay, interbedded with lenses and layers of medium dense sand and silty sand. Underneath this

layer, very stiff to hard clay/silty clay with occasional dense sand and gravel lenses were encountered to the maximum explored depth of 90 feet below ground surface. Groundwater was encountered at a depth of approximately 30 to 40 feet. The groundwater level is anticipated to vary with the passage of time due to seasonal groundwater fluctuation, surface and subsurface flows, ground surface run-off, water level in Guadalupe River, and other factors that may not have been present at the time of the investigation.

6. POTENTIAL GEOTECHNICAL, GEOLOGIC AND SEISMIC IMPACTS WITH PROPOSED MITIGATION MEASURES

6.1. Retaining Walls

Retaining walls are proposed for the transition of the LRT tracks from aerial structures to grade and from the tunnel to grade at various locations: tunnel between Alum Rock station and Silver Creek, Story Road bridge, Tully Road tunnel/bridge, Quimby Road tunnel/bridge, Nieman Road tunnel and Aborn Road/Silver Creek Road bridge. Shallow foundations may be feasible for relatively short retaining walls up to about 10 feet (3 m) in height. Special foundation such as piles may be required for taller walls or for soft ground conditions. Caltrans Standard retaining walls and MSE walls may be appropriate for applications on this project. Generally, MSE walls (in excess of 10 feet (3 m) height) are preferred in soft ground conditions since they can tolerate settlements. Right-of-Way restrictions and construction staging should be taken into consideration. Proper backfill compaction and drainage is imperative in the design and construction of these walls.

6.2. Cut and Cover Tunnels

According to the project plans and profiles, moderately deep excavation will be required for construction of cut-and-cover tunnels at various locations: tunnel between Alum Rock Station and Silver Creek, Tully Road tunnel, Quimby Road tunnel and Nieman Road tunnel. All the proposed tunnels are up to 35-40 feet (10 to 13m) below existing ground surface. Since the excavation is either in the median or crossing southbound Capitol Expressway, unshored cut slopes may not be feasible due to limited space and the need to maintain traffic operations on Capitol Expressway. Because of the expected shallow groundwater depth, it may be necessary to design for buoyant conditions. Since design ground water

Jones & Stokes Associates

Job No. 201162.10 (Capitol Expressway Light Rail Transit Project)

March 31, 2003 (Revised October 2004)

Page 13

elevation is a very critical parameter, further investigation via a site-specific geotechnical exploration program is recommended.

6.3. Aerial Structures

According to the project plans and profiles, aerial structures are proposed at various locations: Story Road bridge, Tully Road bridge, Quimby Road bridge and Aborn Road/Silver Creek Road bridge. Aerial structures are proposed for tracks, platforms and stations.

Standard Caltrans driven piles may be used for the foundation of the aerial structures. According to the preliminary structural plans provided by Jones & Stokes (November 2002), 100-ton piles are assumed for bents and abutments. We anticipate the subsoils to be corrosive. These piles could be standard Class 625C (305 mm (12 inches) minimum, square, Alt. X) or Class 900C (355 mm (14 inches) minimum, square, Alt. X) Precast Prestressed Concrete Piles. Approximate lengths for these piles are given below (for estimating purposes only):

| Pile Type | Compressive Capacity-Service (tons) | Approximate Length (feet) |
|--------------------------------|------------------------------------------------|--------------------------------------|
| Class 625 PC/PS Concrete Piles | 70 | 50 to 60 |
| Class 900 PC/PS Concrete Piles | 100 | 70 to 80 |

Large diameter Cast-In-Drilled Hole (CIDH) piles or Cast In Steel Shell (CISS) piles may be considered on a case-by-case basis. However, CIDH option may not be feasible because of shallow groundwater and anticipated caving conditions. In this case, CISS piles may be considered.

6.4. Erosion and Sedimentation

New embankments are proposed for the project. Typically, the embankments will be retained. Normal maintenance of surface drainage and slope maintenance is important and should be incorporated in the project plans.

6.5. Park-and-Ride Facilities, Electrical Substations and Vehicle Maintenance and Storage Facilities

New Park-and-Ride Facilities, Electrical Substations and Vehicle Maintenance and Storage Facilities are proposed. However, further details are not available at this time. The foundation for these structures is anticipated to be supported on spread footings, thick concrete mat or pile foundation system.

7. STUDY LIMITATIONS

Our services consist of professional opinions based on our site reconnaissance, researched data and the assumption that the subsurface information does not deviate from observed/researched conditions. All work done is in accordance with generally accepted geotechnical engineering principles and practices. No warranty, expressed or implied, of merchantability or fitness, is made or intended in connection with our work or by the furnishing of oral or written reports or findings.

The geotechnical evaluation provided in this report is intended for project design planning. The contents of this report are not intended for design input, nor directly form the basis in preparation of construction cost estimates for bidding purposes. The scope of our services did not include any detail geotechnical investigations (such as bridge foundation report or materials report, California Test Method 130), or any environmental assessment/investigation for the presence or absence of hazardous or toxic materials in structures, soil, surface water, groundwater or air, below or around this site. Unanticipated subsurface conditions are commonly encountered and cannot be fully determined without taking soil samples and drilling/excavating test borings. Additional expenditures should be allowed during the design phase for investigation services so that a properly designed project can be attained.

The findings in this report are valid as of the present date. However, changes in environmental conditions in the project area can occur with the passage of time, whether they are due to natural processes or to the works of man, on this or adjacent properties. In

Jones & Stokes Associates

Job No. 201162.10 (Capitol Expressway Light Rail Transit Project)

LOG OF BORING

LOWER SILVER CREEK, REACH 4
 SANTA CLARA COUNTY, CALIFORNIA

Date: 5/2001 Job No.: 200116.10

This log is part of the report prepared by Parikh Consultants, Inc. for the named project and should be read together with that report for complete interpretation. This summary applies only at the location of this boring and at the time of drilling. Subsurface conditions may differ at other locations and may change at this location with the passage of time. The data presented is a simplification of actual conditions encountered.

Plate:

Environmental Data Resources, Inc. Report (CD containing PDF file)

HAZARDOUS MATERIALS ASSESSMENT REPORT
CAPITOL EXPRESSWAY LIGHT RAIL TRANSIT PROJECT
SAN JOSE, SANTA CLARA COUNTY, CALIFORNIA

SUMMARY OF CONCLUSIONS

This Hazardous Materials Assessment Report was prepared by Parikh Consultants, Inc. to evaluate whether potential sources or indications of hazardous substance contamination are present in the areas of right-of-way and construction for the proposed 8.2-mile Capitol Expressway light rail transit (LRT) extension project along Capitol Expressway from Alum Rock Station to State Route 87. This investigation included a review of previous land uses in the area through review of historical aerial photographs, a field inspection of the project route, and a review of listings of Federal and State regulatory agencies that are responsible for recording incidents of spills, soil and ground water contamination and the transfer, storage, or disposal facilities that handle hazardous materials. This study was a 'broad brush' corridor study, with no site specific review and evaluation included in the analysis.

Previous land uses in the project area were primarily limited to agricultural and residential usage. The agricultural lands surrounding the project area were slowly converted to residential and commercial land usage from the mid 1960's to present. A site reconnaissance of the project area was conducted to identify possible nearby sites or land uses that might adversely affect the corridor due to environmental hazards.

A review of previous land use and the site reconnaissance indicates that the Subject Area along Capitol Expressway has supported vehicular activity since the 1950's. It is highly likely that the surface soils along these areas are affected by deposition of aerial lead. Therefore it is recommended that surface samples of soil be collected and analyzed for total lead content.

There are buildings and structures (including overhead bridges) included in the proposed LRT extension project corridor. Due to the age of these structures there is a potential for presence of asbestos containing materials (ACM) and lead based paint. The ACM investigation should be performed by an AHERA certified inspector under TSCA Title II and Cal OSHA certified under State of California rules and regulations (California Code of Regulations, Section 1529). Surveys for lead based paint should be

conducted prior to demolition of the structures within the right-of-way. Lead based paint and ACM should be abated by using a contractor certified to perform such work.

A review of the report from Environmental Data Resources, Inc. (EDR), which is included as Appendix A of this technical report, and the results of the Subject Area site visit identified two (2) dry cleaners and twelve (12) gasoline stations along the right-of-way. Of the 12 gas stations, seven (7) had active remediation systems operating on-site. Three additional stations were actively monitoring the groundwater. If the right-of-way is to expand entirely into any of these areas, the gas stations should be closed, and underground storage tanks must be removed. If the right-of-way expansion involves encroachment into any of the land within these services stations, soil and groundwater samples should be collected to determine if the portion of the properties that are to be converted, are impacted. For the sites with known active remediation systems or for locations adjacent to dry cleaners, soil and groundwater within the right-of-way, areas should be tested for potential presence of petroleum hydrocarbons, and volatile organic compounds (for dry cleaners only). Based on the results, mitigation measures should be devised to protect construction workers during construction activities. These sites are as follows:

Sparkle Cleaners (Map ID 4-29)
303 S Capital Avenue

Assessment: This site is listed in the FINDS and CLEANERS directory as a small quantity generator. This is a dry cleaning establishment. No additional information is available on this site, however, due to the nature of its business, it is possible that the subsurface soils and groundwater may have been impacted with tetrachloroethene (PCE), which is used in the dry cleaning operations. Assessment of groundwater in the vicinity of this side is recommended.

Chevron #9-8247 (Map ID 4-56)
2710 Story Rd.

Assessment: This site is listed under the LUST, and Cortese lists for impacts to groundwater. According to the EDR, groundwater remediation is currently underway. During the site visit, groundwater remediation system was observed at the site. It is recommended to review site-specific documents to ensure contaminated soil and groundwater is not encountered during work in this area.

SAVEK & Capitol Car Wash (Map ID 4-56)
2701 Story Rd.

Assessment: This site is listed under the LUST, and Cortese lists for presence of MTBE and gasoline in the groundwater. This site is under investigation under supervision of SCVWD and RWQCB. Site soil and groundwater data should be reviewed prior to initiating construction activities.

Southland Company/Shell (Map ID 4-63)
2690 Story Rd.

Assessment: This site is listed under the LUST and Cortese lists for presence of petroleum hydrocarbons in the groundwater. Site is still under investigation and remediation. During the Subject Area visit, groundwater monitoring wells were observed in the Expressway and on-site.

USA Petroleum (Map ID 15-159)
1091 Capitol Expressway

Assessment: This site is listed under the LUST and Cortese list for releases to soil and groundwater discovered during UST removal operations in 1991. This site is still active. During site visit, a groundwater treatment system was observed to be operating on-site. Groundwater monitoring wells were observed on-site and boring locations were observed on Expressway. Reports from this site should be reviewed to determine if the Subject Area maybe impacted.

Rainbow Cleaners (Map ID 15-163)
1027 Capitol Expressway

Assessment: This site is listed under the FINDS and CLEANERS for processing PCE for dry-cleaning operations. There is potential for groundwater at the Subject Area to be impacted from the site operations.

World Oil #79 (Map ID 14-181)
3148 Senter Rd.

Assessment: This site is listed under the LUST and Cortese lists for presence of soil and groundwater contamination from USTs. Site is currently in remediation under supervision of SCVWD. Groundwater is impacted with MTBE. During the site visit groundwater treatment system was observed on-site. This site is directly adjacent to the Subject Area and may have impacted the groundwater. Files of this site should be reviewed further.

Arco #6044 (Map ID 14-181)
3147 Senter Rd.

Assessment: Same as above, this site is listed under the LUST and Cortese lists for presence of soil and groundwater contamination from USTs. Site is currently an 'am/pm gas station' and is being remediated under supervision of SCVWD. Groundwater is impacted with MTBE. During the site visit groundwater treatment system was observed on-site. This site is directly adjacent to the Subject Area and may have impacted the groundwater. Files of this site should be reviewed further.

Chevron Station #97686 (Map ID 14-181)
3151 Senter Rd.

Assessment: Same as the previous two sites, this site is listed under the LUST and Cortese lists for presence of soil and groundwater contamination from USTs. Site is currently being remediated under supervision of SCVWD. Groundwater is impacted with MTBE. During the site visit groundwater treatment system was observed on-site. This site is directly adjacent to the Subject Area and may have impacted the groundwater. Files of this site should be reviewed further.

Shell Service Station (Map ID 19-235)
3939 Snell Avenue

Assessment: Located on the corner of Snell Avenue and Capitol Expressway, this site is listed under the LUST database for release of hydrocarbons to the groundwater. This site is currently under remediation under oversight of SCVWD. During the site visit, a remediation system was operating on-site. Files of this site should be reviewed to ensure that the groundwater is not impacting the Subject Area.

Mobil/BP Oil/Tosco Unocal (Map ID 19-235)
3951 Snell Avenue

Assessment: This site is also located in the corner of Snell and Capitol Expressway. It is listed under the LUST and Cortese lists for release of petroleum hydrocarbons. This site is currently under remediation under oversight of SCVWD. During the site visit, a remediation system was operating on-site. Files of this site should be reviewed to ensure that the groundwater is not impacting the Subject Area.

Other than those noted above during the site reconnaissance of the Subject Area, environmental areas of concern were not readily identified or apparent.

This conclusion, and any and all conclusions, recommendations and information included in this report, are based upon the information that was readily available to Parikh Consultants, Inc. at the time of the site visit, and on Parikh Consultants, Inc.'s professional judgment and reviews using accepted environmental site assessment practices.

1.0 INTRODUCTION

This Hazardous Materials Assessment was performed for the proposed Capitol Expressway LRT Extension Project along Capitol Expressway from Alum Rock Station to State Route 87 (Project Area) (Figure 1).

The purpose of this investigation was to identify and evaluate potential hazardous waste sites and evaluate environmental factors that may have impacted the soil and groundwater quality at the Subject Area due to past and present environmental and commercial activities.

The work for the assessment was performed between December 20, 2002 and February 9, 2003 and included the following scope of work:

- Site visit and visual inspection of exterior of the Subject Area
- Review of site background including aerial photographs
- Review of a computer database government record search of hazardous waste sites within 1-mile radius.
- Review of area hydrogeology.
- Review of available agency records for the Subject Area.
- Preparation of a written report summarizing the results.

This technical report includes the following sections, which present the details and findings of the hazardous materials site assessment:

- Section 2.0 - Project Description and Historic Information
- Section 3.0 - Physical Site Inspection
- Section 4.0 - Regulatory Review
- Section 5.0 - Conclusions and Recommendations
- Section 6.0 - Limitations

2.0 PROJECT DESCRIPTION AND HISTORIC INFORMATION

2.1 PROJECT DESCRIPTION

The existing Capitol Expressway is a heavy traffic route through San Jose. Since 1985, the Santa Clara Valley Transportation Authority (VTA) has been operating light rail service within Santa Clara County. The existing system is 30.5 miles long and has 46 stations. VTA is now proposing to extend the light rail system in the Downtown East Valley area of the City of San Jose. Planning for a light rail alignment along Capitol Expressway has been ongoing since the mid-1990s. In 1995, Barton-Aschman Associates and DeLeuw, Cather & Company completed the *Capitol Corridor LRT Extension Project* report for what was then known as the Santa Clara County Transportation Agency. The report provided an initial definition of the physical and operational aspects of an extension of the light rail system in the Capitol Corridor. The proposed alignment for the extension began at Hostetter Road and proceeded to the existing transit center at Eastridge Mall (Eastridge Transit Center).

The proposed project consists of an 8.2 mile-long (13.2 km) light rail alignment extension along Capitol Expressway from the terminus of the Capitol Avenue LRT Line at the Alum Rock Station to the Eastridge Transit Center and connect with the existing Guadalupe LRT Line at SR 87. The new Capitol Expressway Corridor would have 9 stations, located near Story Road, Ocala/Cunningham Avenue, Eastridge Mall, Nieman Boulevard, McLaughlin Avenue, Senter Road, Monterey Highway, Vistapark Drive and Highway 87. The alternative includes a potential future station at Silver Creek Road.

Alignment Description

The proposed light rail alignment would operate in exclusive and semi-exclusive rights-of-way and would include both grade-separated and at-grade intersection crossings. The alignment would operate primarily in the median of Capitol Expressway; however, some short alignment sections and options would deviate from the median.

The proposed Light Rail Alternative would be designed for high-speed service, with signal priority at intersections and grade separation at congested intersections. Crossings at freeways, expressways, and some major arterials would also be grade-separated (either elevated or depressed) to further support high-speed transit operations.

Construction of the light rail guideway and grade-separated structures under this alternative would alter the roadway geometry along some portions of Capitol Expressway. Perhaps the most dramatic change to the expressway would be the removal of existing HOV lanes between Capitol Avenue and U.S. 101. Since the existing roadway width could accommodate light rail if modified, the HOV lanes would be removed to provide the additional right-of-way. This minimizes the need to acquire additional property for the proposed Light Rail Alternative. Except for a slight reduction in lane width, no modifications to the remaining traffic lanes would be required. Left turns and through movements would not be affected, and all three existing through traffic lanes would remain in place.

Under the proposed Light Rail Alternative, the streetscape of Capitol Expressway would be redesigned to create an urban parkway. Pedestrian-friendly improvements—such as redesigning the right turn lanes to reduce their cross-section width to make pedestrian movements across the roadway shorter and easier—would be implemented at intersections. Additionally, the design would incorporate trees along the light rail median and along the curb edge of the roadway. A multi-use linear path along part of Capitol Expressway is also proposed. The path would be approximately 16 feet wide and would include a 10-foot-wide pedestrian/bicycle pathway, along with landscaping, soundwalls, benches, and trash receptacles. Curb lanes on both sides of Capitol Expressway will be 17 to 18 feet for the entire length to allow use of the shoulders of Capitol Expressway by bicycles.

The following sections describe the vertical and horizontal alignment options for each segment of the light rail corridor, and related track design and support systems.

Alum Rock Station to Story Road

The light rail alignment would begin at the existing Alum Rock Station on the Capitol Avenue LRT Line. In this segment, the alignment could be constructed in the median of Capitol Expressway from the Alum Rock station until just north of Story Road. The light rail alignment would be constructed at-grade for most of its course along Capitol Expressway. However, in this section of the corridor, an aerial guideway would be constructed for the full distance from south of Alum Rock Station to south of Story Road. The guideway would be located in the median of Capitol Avenue and Capitol Expressway and would be approximately 4,000 feet long. At its northern end, the aerial structure would cross the northbound lanes of Capitol Avenue and Capitol Expressway and transition to an alignment in the median of Capitol Expressway. The light rail

alignment would continue on the aerial structure over Story Road and resume a ground-level profile south of Story Road.

Two vertical profile options are under consideration. Both options include two bus bays on Story Road (east of Capitol Expressway) and a kiss-and-ride lot on the southeast corner of the intersection.

- **Capitol Avenue/Capitol Expressway Tunnel/Story Road Aerial Option:** Under this option, a 1,330-foot-long tunnel would be constructed from south of Alum Rock Station, under the intersection of Capitol Expressway and Capitol Avenue and the northbound lanes of Capitol Expressway, to a point 20 feet north of Silver Creek. At this point, the alignment would leave the tunnel and transition to a 2,600-foot-long aerial structure that would cross Story Road. The aerial structure would continue south past Story Road, where it would transition back to ground level. Both the tunnel and the aerial structure would be located in the median of Capitol Avenue and Capitol Expressway.
- **Capitol Avenue/Capitol Expressway/Story Road Tunnel Option:** A 3,950-foot tunnel would be constructed from north of Capitol Avenue/Capitol Expressway to south of Story Road. It would be constructed in the median. The tunnel would pass under Capitol Avenue/Capitol Expressway intersection, cross under Silver Creek and Story Road before returning to a ground-level profile 1,225 feet south of Story Road. The tunnel option would include a depressed, open-air station at Story Road.

Story Road to Eastridge Transit Center

From south of Story Road, the alignment would be at-grade through the Ocala and Cunningham Avenue intersections. Before reaching Tully Road, a tunnel would provide a grade-separated transition from the median-running configuration along Capitol Expressway to the side-running configuration of the new station at Eastridge Transit Center. The Tully Road tunnel would measure approximately 2,150 feet. In addition to removing light rail operations from the congested intersection of Tully Road, the grade separations in this area would serve to transition the light rail alignment between median- and side-running operations. One alignment and station option is being considered.

- **North of Eastridge Transit Center Aerial Crossing with Aerial Station Option:** An aerial guideway would be constructed to transition the alignment from median-running north of Tully Road to side-running south of Tully Road in the Eastridge Transit Center. The proposed station at the Eastridge Transit Center would be located on the aerial guideway.

Eastridge Transit Center to Aborn Road

South of the at-grade Eastridge Transit Center, the alignment would enter a retained cut section that would drop the tracks onto a tunnel structure carrying the light rail under the southbound Capitol Expressway lanes and Quimby Road. From that point, it would return to grade through another retained cut section in the median south of Quimby Road and remain at-grade until it reaches Aborn Road. The following four vertical alignment options are under consideration between the Eastridge Transit Center and Aborn Road.

- **South of Eastridge Transit Center Aerial Crossing Option (Only with Eastridge Aerial Station Option):** If the alignment comes into the Eastridge Transit Center on an aerial structure, it would remain on an aerial structure as it continues south across the southbound Capitol Expressway lanes and Quimby Road, where it would return to grade through another retained fill section in the median south of Quimby Road and remain at-grade to the vicinity of Aborn Road.
- **South of Eastridge Transit Center Side-Running/Tunnel at Nieman Boulevard Option:** South of the Eastridge Transit Center, the alignment would continue as side-running until the Nieman Station on the west side of the Capitol Expressway north of Nieman Boulevard, where it would transition back to the median via a cut section that would drop the tracks onto a tunnel structure under southbound Capitol Expressway. From that point, it would return to grade through another retained cut section in the median south of Nieman Boulevard and remain at-grade to the vicinity of Aborn Road.
- **South of Eastridge Transit Center Side-Running/Trench Option:** South of Eastridge Transit Center, the alignment would enter a retained cut section that would drop the tracks onto a trench structure carrying the light rail under the Eastridge Loop Road and Quimby Road, where it would return to grade through another retained cut section south of Quimby Road continuing at-grade through the Nieman Station. At this point, it would enter a retained cut section that would drop the tracks into a tunnel structure carrying the light rail under the southbound Capitol Expressway lanes, where it would return to grade through another retained cut section in the median south of Nieman Boulevard and remain at-grade to the vicinity of Aborn Road.
- **South of Eastridge Transit Center Side-Running At-Grade/Aerial Option:** South of the Eastridge Transit Center, the alignment would continue as at-grade, side-running until the Nieman Boulevard Station on the west side of Capitol Expressway north of Nieman Boulevard.

Aborn Road to Silver Creek Road

The alignment would cross Aborn Road at grade and Silver Creek Road via an aerial structure. The length of the aerial structure from the beginning of the first retained fill section to the end of

the last retained fill section would be approximately 2,800 feet. There are two design options at Nieman Boulevard/Aborn Road. Each of these options would transition to an aerial structure for the alignment to cross Silver Creek Road.

- **Aerial Crossing at Aborn Road Option:** An aerial guideway would be constructed in the median from before the Aborn Road intersection through the Silver Creek Road intersection. The total length of the structure would be 8,000 feet.
- **Aerial Crossing at Aborn Road Option (Only with Side-Running Options):** If the aerial option at Aborn Road is from the side-running segment to the median, the aerial guideway would begin before Nieman Boulevard and continue through both Aborn Road and the Silver Creek intersection. The total length of the structure would be 9,500 feet.

Silver Creek Road to Coyote Creek

The alignment would continue on the aerial structure through the potential future Silver Creek Station and transition back to the level of Capitol Expressway through another retained fill section just before the Capitol Expressway overpass of U.S. 101, then continue in the median of Capitol Expressway over U.S. 101 through McLaughlin Road to Coyote Creek. One design option is under consideration for the section between Silver Creek Road and Coyote Creek.

- **Aerial Crossing of U.S. Highway 101 Option:** The alignment would remain elevated through the optional future Silver Creek Station, as described above. However, in this option, the alignment would continue on a separate aerial structure across southbound Capitol Expressway on the north side of the overpass crossing of U.S. 101. After crossing U.S. 101, the alignment would proceed across the southbound Capitol Expressway lanes over McLaughlin Avenue, through the proposed McLaughlin Avenue Station, and transition back to grade level through another retained fill section just before Coyote Creek.

Coyote Creek to Highway 87

The alignment would proceed in the median of Capitol Expressway for the entire length of the section between Coyote Creek and the end of the alignment near SR 87.

Several sites exist along Capitol Expressway for park-and-ride facilities. Three existing park-and-ride lots are located along the alignment: Alum Rock Station, Eastridge Transit Center, and Capitol Station (at SR 87). A fourth park-and-ride lot within the corridor is located at the intersection of Monterey Highway and Fehren Drive. This facility serves the Caltrain Capitol station, which lies approximately 2,000 feet north of Capitol Expressway. To serve the Light Rail Alternative, two additional facilities are needed, including an expanded park-and-ride facility at the Eastridge Transit Center, and a site on the southwest corner of Ocala Avenue and Capitol Expressway to serve the Ocala Station.

In addition, the Light Rail Alternative would include options for two new park-and-ride facilities to meet the forecasted demand:

- **Expanded Eastridge Transit Center Park-and-Ride Option (Only if No Ocala Avenue Station Park-and-Ride):** If there is no park-and-ride at the Ocala Avenue Station, then the Eastridge Transit Center Park-and-Ride would need to be expanded to accommodate the demand.
- **Monterey Highway Station Park-and-Ride Options:** To serve the relocated Capitol Caltrain Station and the proposed Monterey Highway Station, three park-and-ride options with a bus transfer center are under consideration.
 - **Monterey Highway Cloverleaf Option:** Located in the center of the cloverleaf ramps on the east side of Monterey Highway both north and south of Capitol Expressway.
 - **Northwest of Monterey Highway Station Option:** This option would locate the park-and-ride facility at a site to the northwest of the Monterey Highway Station.
 - **Northeast of Monterey Highway Station Option:** This option would locate the park-and-ride facility at a site to the northeast of the Monterey Highway Station and north of the cloverleaf ramps at Capitol Expressway.

2.2 HISTORICAL OVERVIEW

Based on historical aerial photographs reviewed, it appears that majority of the Subject Area was in agricultural use or undeveloped or used as residential and commercial properties in the 1950's. The later aerial photos show development of freeways, railroads and Capitol Expressway. The area surrounding the Subject Area has been developed with residential and commercial properties through time.

Based on review of USGS maps (East San Jose, 7.5 Minute) the elevation of the Subject Area varies from 110 to 160 feet. Several creeks including Coyote Creek and Silver Creek cross and or run the Subject Area. These creeks cross under the expressway or run parallel with it. Regional depth to groundwater gradient is also generally towards the north but could vary on a site specific basis. Based on review of

groundwater well data, depth to groundwater ranges from 6 to 40 feet in the Subject Area the corridor of Capitol Expressway.

2.3 HISTORICAL AERIAL PHOTOGRAPH REVIEW

To examine the historical use of the Subject Area, a review of available aerial photographs from 1957 to 1999 was performed at Pacific Aerial Surveys in Alameda, California. Approximately 22 aerial photographs encompassing the Subject Area were examined. A summary description of the photographs reviewed is presented below.

Review of the 1957 through 1999 aerial photographs showed Subject Area is mostly occupied by agricultural or vacant land in the earlier years. The aerial photographs indicate development of commercial and residential properties through out the years. Development of Capitol Expressway into its current shape is visible from the early 1970's. Completion of the Expressway is seen in the mid 1990's.

The remaining aerial photographs do not show any significant changes in the Subject Area except for the construction of interchange and development of service stations that exist on the interchanges adjacent to the Subject Area. Remainder of the aerial photograph show the properties surrounding the interchange either as vacant land or in agricultural use.

Issues of environmental concern other than noted above were not observed during the aerial photograph review.

2.4 HISTORICAL U.S.G.S MAP REVIEW

Historical U.S.G.S. maps for San Jose and East San Jose from years 1899, 1953, 1961, 1968, 1973, and 1980 were reviewed. These maps are included as Appendix A. These maps indicate presence of Coyote Creek and Silver Creek. The 1899 San Jose U.S.G.S. map shows that the Silver Creek and Penitencia Creek merged to form a larger creek prior to joining Coyote Creek. It also shows presence of Southern Pacific Railroad in the current location of Union Pacific Railroad lines.

3.0 PHYSICAL SITE INSPECTION

Observations made during the site inspection walk through at the Subject Site are described in the following paragraphs. The site inspection was performed on Friday January 24, 2003.

3.1 SITE VISIT

Subject Area visit consisted of drive through of the area of study and observation of problem sites or visual contamination.

The Subject Area begins near the intersection of Capitol Expressway and Capitol Avenue just east of Route 680 and traverses 8.2 miles in the south/southwest direction until the intersection with Route 87.

Capitol Avenue to Story Road

The following paragraph describes the Subject Area from Capitol Avenue to Story Road. From Capitol Avenue until Story Road, majority of the property along the eastern and western portion of the Subject Area is occupied by residential properties. At the Story Road intersection are three service stations and an auto parts sales shop. To the north of the intersection right before the service stations to the west is a small retail area. To the east are a car wash and a church.

A world service station is located on the northwestern side of the Story Road intersection. One groundwater monitoring well (monitoring well) was observed in the traffic lanes of Capitol Expressway (Expressway). Several other monitoring wells were observed on the service station property away from those normally attributed to underground storage tanks (USTs). To the east across from the Expressway is Gas & Shop service station with several groundwater monitoring wells located on-site. To the south on the southwestern side of the intersection is a Chevron service station with several monitoring wells and an active groundwater remediation system.

Story Road to Eastridge Transit Center

From Story Road traveling south on the Expressway, the properties along the eastern and western side of the road are occupied by residential areas north of Ocala Road. From Ocala Road to Tully Road, the property to the western side is occupied by Reed Hillview Airport. South of Hillview Airport and north of Tully is a vacant lot. On the Hillview Airport 200-300 feet west of the Expressway is a Chevron Service station. On the East side of the Expressway south of Ocala road are residential properties, followed by Raging Waters, a commercial recreation facility, and a site under construction.

South of Tully Road to the west is an open field followed by Eastridge Mall. East of Eastridge Mall just next to the Expressway is a VTA transit stop. To the east of the Expressway south of Tully Road are a number of commercial and residential properties.

Eastridge Transit Center to Aborn Road

To the south of the Transit Center are a number of commercial properties. Further south, at the northwestern intersection of Quimby and Expressway is an Arco Service Station. Further to the west is Circuit City in a commercial mall. In the space between Circuit City and Arco, several monitoring wells were observed. To the south of Quimby on the western side of the intersection are a Public Storage Facility and more light commercial properties. From Quimby to Aborn Road, the west side of the Expressway is occupied by commercial properties. To the east are a number of residences.

Aborn Road to Coyote Creek

From Aborn Road to Coyote Creek, the Expressway travels through Silver Creek Road, traverses over US 101, and crosses McLaughlin and Tuers Road before reaching Coyote Creek. From Aborn Road to Silver Creek, the western side of the Expressway is occupied by a number of commercial properties. Of most interest with regards to environmental impacts is a Speedy Oil Change, however during the site visit, monitoring wells or other evidence of environmental impacts were not evident. On the east side is residential properties. On the southwestern side of the Silver Creek intersection is a Chevron service station and a car wash. Monitoring wells typically associated with environmental impacts were not observed on this site. On the southeastern side of the intersection is a retail area housing several small commercial stores and restaurants.

Traveling southwest over Route 101, before McLaughlin Road, are residential properties to the north and south of the Expressway. To the west of the McLaughlin interchange is a USA Gasoline service station with several groundwater monitoring wells and a remediation system. Traveling towards the southwest along the western side is a shopping mall including a Rite Aide Store before Tuers Road. Further to the southwest is Coyote Creek. To the southeast are residential properties.

Coyote Creek to Highway 87

From Coyote Creek to Highway 87, the Expressway crosses Senter Road, Monterey Road, UPRR tracks, and Monterey Highway, Snell Road, Vista Park Road, Copperfield Road, before reaching Route 87.

From Coyote Creek to Senter Road, the north side of the Expressway is occupied by residential properties followed by a World service station at the north side of the intersection. To the south

is Andrew Hill High School. At the intersection of Senter Road and the Expressway are three service stations (including World). These stations are located on the northern, western and southern side of the intersection and are World, AM/PM, and Chevron. During the area reconnaissance monitoring wells and remediation systems were observed associated with all three service stations.

Past this intersection, the Expressway travels south and changes direction towards the southwest before crossing over Monterey Highway and reaching Snell Road. Along this stretch, the Expressway is surrounded mainly by residential properties. The commercial properties are located mostly along the smaller intersections and consist of retail shops. Once the Expressway travels over the Monterey Highway, a Drive-In theatre used for weekend Flea Market is to the northwest just before Snell Road.

At the intersection of the Expressway and Snell Road are three service stations. To the north is a Beacon, to the west a Shell and to the south a Union 76 station. Monitoring wells and remediation systems were observed on the Shell and the Union 76 stations. The east of the intersection is a residential property.

Traveling further west past Snell Road, the area on both the north and south side of the Expressway are occupied by vacant land under construction, residential developments, and commercial lots that house restaurants, video stores, and a Home Depot. Past the Home Depot across from Norvaez Road, on both the north and south side of the Expressway are VTA transit parking and stations.

Aside from the service stations, monitoring wells, and treatment systems identified, no other areas with potential environmental concern were noted.

3.2 AERIAL LEAD DEPOSITION

The Subject Area is a traffic bearing road in the Santa Clara County area. Historical aerial photographs show that the Subject Area has supported vehicular traffic from the early 1950's. Due to this vehicular activity the soils along the Subject Area are likely contaminated with lead from exhaust of cars burning leaded gasoline. The lead levels in surface soils along highways can reach concentrations in excess of the hazardous waste threshold, requiring disposal at either a Class I landfill or on-site stabilization. Special health and safety procedures should be in effect for the workers working near lead contaminated areas. A workplan for investigation of the ADL should be submitted and work should be performed according to an approved workplan.

3.3 ASBESTOS CONTAINING MATERIALS AND LEAD PAINT

There are buildings and structures within the proposed LRT extension corridor. Due to the age of these structures there is a potential for presence of asbestos containing materials (ACM) and lead based paint. The ACM investigation should be performed by an AHERA certified inspector under TSCA Title II and Cal OSHA certified under State of California rules and regulations (California Code of Regulations, Section 1529). Surveys for lead based paint should be conducted prior to demolition of the structures within the right-of-way. Lead based paint and ACM should be abated by using contractors certified to perform such work.

4.0 REGULATORY REVIEW

4.1 DATABASE AND REGULATORY REVIEWS

A search of environmental regulatory databases was conducted for the site and surrounding properties. The database search was conducted by Environmental Data Resources, Inc. (EDR) to determine whether documentation exists related to environmental incidents at the site or surrounding properties. The databases searched and respective search distances from the site as specified by ASTM guidelines are as follows:

- Federal Databases
 - National Priority List (NPL) – 1 mile
 - Proposed National Priority List (Proposed NPL) – 1 mile
 - Comprehensive Environmental Response Compensation, and Liability Information System (CERCLIS) – ½ mile
 - CERCLIS No Further Remedial Action Planned (CERCLIS – NFRAP) – ¼ mile
 - Corrective Action Report (CORRACTS) – 1 mile
 - Resource Conservation and Recovery Information System treatment, storage disposal facility (RCRIS-TSD) – ½ mile
 - RCRIS Large quantity generator – ¼ mile
 - RCRIS small quantity generator – ¼ mile
 - Emergency Response Notification System (ERNS) – Target Property
 - Superfund (CERCLA) Consent Decrees (CONSENT) – 1 mile
 - Records of Decision (ROD) – 1 mile
 - Delisted NPL – 1 mile

- Facility Index System/Facility Identification Initiative Program Summary Report (FINDS) – Target Property
- Hazardous Material Reporting System (HMIRS) – Target Property
- Material Licensing Tracking System (MLTS) – Target Property
- Mines master index file (MINES) – ¼ mile
- Federal Superfund liens (NPL liens) – Target Property
- PCB Activity Database System (PADS) – Target Property
- RCRA Administration Action Tracking System – Target Property
- Toxic Chemical Release Inventory System (TRIS) – Target Property
- Toxic Substance Control Act (TSCA) – Target Property
- Section 7 Tracking System (SSTS) – Target Property
- FIFRA/TSCA Tracking System (FTTS) – Target Property

- State of California, Regional and County Databases
 - Annual Workplan Sites (AWP) – 1 mile
 - Cal sites Databases (CAL-SITES) – 1 mile
 - California Hazardous Material Incident Report System (CHMIRS) – 1 mile
 - “Cortese” Hazardous Waste and Substance Sites List (CORTESE) – 1 mile
 - Proposition 65 Records (NOTIFY 65) – 1 mile
 - Toxic Pits Cleanup Act Sites (TOXIC PITS) – 1 mile
 - State Landfill – ½ mile
 - Waste Management Unit Database (WMUDS/SWAT) – ½ mile
 - Leaking Underground Storage Tank Information System (LUST) – ½ mile
 - Bond expenditure Plan (CA BOND EXP. PLAN) – 1 mile
 - Active UST Facilities (UST) – ¼ mile
 - Facility Inventory Database (CA FID UST) – ¼ mile
 - Hazardous Substance Storage Container Database (HIST UST) – ¼ mile
 - Aboveground Petroleum Storage Tank Facilities (AST) – Target Property
 - Cleaner Facilities (CLEANERS) – ¼ mile
 - Waste Discharge System (CA WDS) – Target Property
 - List of Deed Restrictions (DEED) – Target Property
 - Spills, Leaks, Investigation and Cleanup Cost Recovery Listing (CAL SLIC) – ½ mile
 - Hazardous Waste Information System (HAZNET) – ¼ mile

The results of the EDR database search and descriptions of the environmental databases are provided in Appendix B. The sites identified in the EDR search were evaluated with respect to their potential to impact the Site adversely. Three main criteria were used to evaluate whether the EDR listed sites warranted further consideration: (1) proximity to the site (less than 1/8 mile); (2) hydraulically upgradient with respect to groundwater flow; and (3) hydraulically upgradient of the site with respect to surface water flow/storm water runoff.

No NPL, proposed NPL, CERCLIS, CORRACTS, RCRIS-TSD, AWP, Toxic Pits, CA Bond Expenditure, CA FID UST, CONSENT, ROD, Delisted NPL, HMRS, MLTS, MINES, NPL Liens, PADS, RAATS, TSCA, SSTS were identified within the 1 mile of the Subject Area. The single CERCLIS NF-RAP site that was identified is too far away and cross gradient and should not pose an environmental concern.

Five RCRIS sites were identified in the Database. These sites are too far away to pose an adverse environmental impact and are eliminated from further discussion.

A majority of the sites identified on the database are either small quantity waste generators, or those listed on the FINDS and Cortese databases. A majority of these sites were covered under the LUST sites. The remainders are too far away to pose an environmental concern.

198 LUST sites and several Cortese and sites listed on the Cleaners (dry cleaners) were identified within one mile of the Subject Area. A majority of these sites are either closed, too far upgradient, and/or downgradient of the Subject Area and should not pose an environmental concern. Only those with proximity to the Subject Area that could be of potential environmental concern are discussed below. Detail discussion of these sites for each segment of the road described during the Subject Area visit are as follows:

Capitol Avenue to Story Road

Exxon Service Station No. 7-3297 (Map ID 4-18)
2710 Alum Rock Ave/Capitol Expwy.
San Jose, CA 95127

Assessment: This site was listed for presence of petroleum hydrocarbons discovered during closure of a UST in 1992. This site was under RWQCB review in 1997 and closed in 1998. This site should not pose further environmental concern.

Sparkle Cleaners (Map ID 4-29)
303 S Capitol Avenue
San Jose, California

Assessment: This site is listed in the FINDS and CLEANERS directory as a small quantity generator. This is a dry cleaning establishment. No additional information is available on this site, however, due to the nature of its business, it is possible that the subsurface soils and groundwater may have been impacted with tetrachloroethene (PCE) that is used in the dry cleaning operations. Assessment of groundwater in the vicinity of this side is recommended.

Chevron #9-8247 (Map ID 4-56)
2710 Story Rd.
San Jose, California

Assessment: This site is listed under the LUST, and Cortese lists for impacts to groundwater. According to the EDR, groundwater remediation is currently underway. During the site visit, groundwater remediation system was observed at the site. It is recommended to review site specific documents to ensure contaminated soil and groundwater is not encountered during work in this area.

SAVEK & Capitol Car Wash (Map ID 4-56)
2701 Story Rd.
San Jose, California

Assessment: This site is listed under the LUST, and Cortese lists for presence of MTBE and gasoline in the groundwater. This site is under investigation under supervision of SCVWD and RWQCB. Site soil and groundwater data should be reviewed prior to initiating construction activities.

Southland Company/Shell (Map ID 4-63)
2690 Story Rd.
San Jose, California

Assessment: This site is listed under the LUST and Cortese lists for presence of petroleum hydrocarbons in the groundwater. Site is still under investigation. Additional assessment of the soil and groundwater in this site is recommended. During the Subject Area visit, groundwater monitoring wells were observed in the Expressway and on-site.

Story Road to Eastridge Transit Center

Airport Properties (Map ID 7-87)
20502 John Montgomery Dr.
San Jose, California

Assessment: This site is listed under the LUST and Cortese lists for discovery of groundwater impacts in 1991. Case was closed later on. This site should not pose an adverse environmental impact.

Gee Bee Aero (Map ID 7-91)
2660 John Montgomery Dr.
San Jose, California

Assessment: This site is listed under the LUST list for discovery of soil impacts during removal of a waste oil UST. This site was closed in 1995.

SCCTA – Reid-Hillview Airport (Map ID 7-94)
2500 Cunningham Avenue,
San Jose, California

Assessment: This site is listed under the LUST list for release of diesel to soil and groundwater. The case is closed. No further assessment is necessary.

Eastridge Transit Center to Aborn Road

ARCO #2187 (Map ID 10-116)
2375 Quimby Rd.
San Jose, California

Assessment: This site is listed on the LUST list for release of petroleum hydrocarbons. The case was closed in 1995. This site should not pose further environmental concern. During the site visit two monitoring wells were observed on the western side of the site.

Speedee Oil Change and Tune-up (Map ID 10-125)
1825 E. Capitol Expressway
San Jose, California

Assessment: This site is listed under the HAZNET list. No records of violations or releases are present. It should not pose an environmental concern.

Aborn Road to Coyote Creek

Silver Creek Carwash (Map ID 10-152)
3197 Silver Creek Rd.
San Jose, California

Assessment: This site is listed under the LUST and Cortese list for discovery of release of diesel to soil and groundwater. The case was closed in 1996. This site should not pose an environmental concern. During the site visit no groundwater monitoring wells were observed on-site, or on the Expressway.

USA Petroleum (Map ID 15-159)
1091 Capitol Expressway
San Jose, California

Assessment: This site is listed under the LUST and Cortese list for releases to soil and groundwater discovered during UST removal operations in 1991. This site is still active. During site visit, a groundwater treatment system was observed to be operating on-site. Groundwater monitoring wells were observed on-site and boring locations were observed on Expressway. Reports from this site should be reviewed to determine if the Subject Area maybe impacted.

Rainbow Cleaners (Map ID 15-163)

1027 Capitol Expressway
San Jose, California.

Assessment: This site is listed under the FINDS and CLEANERS for processing PCE for dry-cleaning operations. There is potential for groundwater at the Subject Area to be impacted from the site operations.

Coyote Creek to Highway 87

World Oil #79 (Map ID 14-181)

3148 Senter Rd.
San Jose, California

Assessment: This site is listed under the LUST and Cortese lists for presence of soil and groundwater contamination from USTs. Site is currently in remediation under supervision of SCVWD. Groundwater is impacted with MTBE. During the site visit groundwater treatment system was observed on-site. This site is directly adjacent to the Subject Area and may have impacted the groundwater. Files of this site should be reviewed further.

Arco #6044 (Map ID 14-181)

3147 Senter Rd.
San Jose, California

Assessment: Same as above, this site is listed under the LUST and Cortese lists for presence of soil and groundwater contamination from USTs. Site is currently an AM/PM gas station and is being remediated under supervision of SCVWD. Groundwater is impacted with MTBE. During the site visit groundwater treatment system was observed on-site. This site is directly adjacent to the Subject Area and may have impacted the groundwater. Files of this site should be reviewed further.

Chevron Station #97686 (Map ID 14-181)

3151 Senter Rd.
San Jose, California.

Assessment: Same as the previous two sites, this site is listed under the LUST and Cortese lists for presence of soil and groundwater contamination from USTs. Site is currently being remediated under supervision of SCVWD. Groundwater is impacted with MTBE. During the site visit groundwater treatment system was observed on-site. This site is directly adjacent to the Subject Area and may have impacted the groundwater. Files of this site should be reviewed further.

Chevron #9-5921 (Map ID 19-228)

175 W. Capitol Expressway
San Jose, California

Assessment: This site is listed under the LUST database for release of petroleum hydrocarbons to soil and groundwater. This case is closed. This site should not pose an environmental concern.

Shell Service Station (Map ID 19-235)

3939 Snell Avenue
San Jose, California

Assessment: Located on the corner of Snell Avenue and Capitol Expressway, this site is listed under the LUST database for release of hydrocarbons to the groundwater. This site is currently under remediation under oversight of SCVWD. During the site visit, a remediation system was operating on-site. Files of this site should be reviewed to ensure that the groundwater is not impacting the Subject Area.

Mobil/BP Oil/Tosco Unocal (Map ID 19-235)

3951 Snell Avenue
San Jose, California

Assessment: This site is also located in the corner of Snell and Capitol Expressway. It is listed under the LUST and Cortese for release of petroleum hydrocarbons. This site is currently under remediation under oversight of SCVWD. During the site visit, a remediation system was operating on-site. Files of this site should be reviewed to ensure that the groundwater is not impacting the Subject Area.

South Bay Pontiac Cadillac (Map ID 18-242)

765 W. Capitol Expressway
San Jose, California

Assessment: This site is listed on the LUST and Cortese databases for release of gasoline to groundwater. This site is however on the west side of Route 87 and should not pose an environmental concern. This site is listed by mistake on the Facility ID Map on the eastern side of Route 87.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Review of previous land use and the site reconnaissance indicates that the Subject Area along Capitol Expressway area has supported vehicular activity since the 1950's. It is highly likely that the surface soils along these areas are affected by deposition of aerial lead. Therefore it is recommended that surface samples of soil be collected and analyzed for total lead.

There are buildings and structures (including overhead bridges) within the proposed LRT extension project. Due to the age of these structures there is a potential for presence of asbestos containing materials (ACM) and lead based paint. The ACM investigation should be performed by an AHERA

certified inspector under TSCA Title II and Cal OSHA certified under State of California rules and regulations (California Code of Regulations, Section 1529).

Surveys for lead based paint should be conducted prior to demolition of the structures within the right-of-way. Lead based paint and ACM should be abated by using a contractor certified to perform such work.

A review of the EDR report, and the Subject Area site visit identified two dry cleaners and 12 gasoline stations along the right-of-way. Of the 12 gas stations, seven had active remediation systems operating on-site. Three additional stations were actively monitoring the groundwater. If the right-of-way is to expand into any of these areas, the gas stations should be closed, and underground storage tanks must be removed. If the right-of-way expansion involves encroachment into any of the land within these services stations, soil and groundwater samples should be collected to determine if the portion of the properties that are to be converted, are impacted. For the sites with known active remediation systems and for locations adjacent to dry cleaners, soil and groundwater within the right-of-way along these areas should be tested for potential presence of petroleum hydrocarbons, and volatile organic compounds (for dry cleaners only). Based on the results, mitigation measures should be devised to protect construction workers during construction activities. These sites are as follows:

Sparkle Cleaners (Map ID 4-29)
303 S Capitol Avenue

Assessment: This site is listed in the FINDS and CLEANERS directory as a small quantity generator. This is a dry cleaning establishment. No additional information is available on this site, however, due to the nature of its business, it is possible that the subsurface soils and groundwater may have been impacted with tetrachloroethene (PCE), which is used in the dry cleaning operations. Assessment of groundwater in the vicinity of this side is recommended.

Chevron #9-8247 (Map ID 4-56)
2710 Story Rd.

Assessment: This site is listed under the LUST, and Cortese lists for impacts to groundwater. According to the EDR, groundwater remediation is currently underway. During the site visit, groundwater remediation system was observed at the site. It is recommended to review site specific documents to ensure contaminated soil and groundwater is not encountered during work in this area.

SAVEK & Capitol Car Wash (Map ID 4-56)

2701 Story Rd.

Assessment: This site is listed under the LUST, and Cortese lists for presence of MTBE and gasoline in the groundwater. This site is under investigation under supervision of SCVWD and RWQCB. Site soil and groundwater data should be reviewed prior to initiating construction activities.

Southland Company/Shell (Map ID 4-63)

2690 Story Rd.

Assessment: This site is listed under the LUST and Cortese lists for presence of petroleum hydrocarbons in the groundwater. Site is still under investigation and remediation. During the Subject Area visit, groundwater monitoring wells were observed in the Expressway and on-site.

USA Petroleum (Map ID 15-159)

1091 Capitol Expressway

Assessment: This site is listed under the LUST and Cortese list for releases to soil and groundwater discovered during UST removal operations in 1991. This site is still active. During site visit, a groundwater treatment system was observed to be operating on-site. Groundwater monitoring wells were observed on-site and boring locations were observed on Expressway. Reports from this site should be reviewed to determine if the Subject Area maybe impacted.

Rainbow Cleaners (Map ID 15-163)

1027 Capitol Expressway

Assessment: This site is listed under the FINDS and CLEANERS for processing PCE for dry-cleaning operations. There is potential for groundwater at the Subject Area to be impacted from the site operations.

World Oil #79 (Map ID 14-181)

3148 Senter Rd.

Assessment: This site is listed under the LUST and Cortese lists for presence of soil and groundwater contamination from USTs. Site is currently in remediation under supervision of SCVWD. Groundwater is impacted with MTBE. During the site visit groundwater treatment system was observed on-site. This site is directly adjacent to the Subject Area and may have impacted the groundwater. Files of this site should be reviewed further.

Arco #6044 (Map ID 14-181)

3147 Senter Rd.

Assessment: Same as above, this site is listed under the LUST and Cortese lists for presence of soil and groundwater contamination from USTs. Site is currently an am/pm gas station and is being remediated under supervision of SCVWD. Groundwater is impacted with MTBE. During the site visit groundwater treatment system was observed on-site. This site is directly adjacent to the Subject Area and may have impacted the groundwater. Files of this site should be reviewed further.

Chevron Station #97686 (Map ID 14-181)
3151 Senter Rd.

Assessment: Same as the previous two sites, this site is listed under the LUST and Cortese lists for presence of soil and groundwater contamination from USTs. Site is currently being remediated under supervision of SCVWD. Groundwater is impacted with MTBE. During the site visit groundwater treatment system was observed on-site. This site is directly adjacent to the Subject Area and may have impacted the groundwater. Files of this site should be reviewed further.

Shell Service Station (Map ID 19-235)
3939 Snell Avenue

Assessment: Located on the corner of Snell Avenue and Capitol Expressway, this site is listed under the LUST database for release of hydrocarbons to the groundwater. This site is currently under remediation under oversight of SCVWD. During the site visit, a remediation system was operating on-site. Files of this site should be reviewed to ensure that the groundwater is not impacting the Subject Area.

Mobil/BP Oil/Tosco Unocal (Map ID 19-235)
3951 Snell Avenue

Assessment: This site is also located in the corner of Snell and Capitol Expressway. It is listed under the LUST and Cortese for release of petroleum hydrocarbons. This site is currently under remediation under oversight of SCVWD. During the site visit, a remediation system was operating on-site. Files of this site should be reviewed to ensure that the groundwater is not impacting the Subject Area.

Other than noted above during the site reconnaissance of the Subject Area, environmental areas of concern were not readily identified or apparent based on the scope of work performed in this project. Based on Parikh Consultants, Inc.'s findings, environmental conditions or issues of concerns, other than noted above, were not identified or indicated.

6.0 LIMITATIONS

The operations, facility conditions and information obtained and utilized in the preparation of this report have been obtained in part from the client, and their employees or agents, and various government officials and are assumed by Parikh Consultants, Inc. to be complete and correct. It should be noted that

Jones & Stokes
Capitol Expressway LRT Extension
Job No.: 201162.ISA
February 19, 2003
Page 26

this information is subject to professional interpretation, which leads to conclusions, which may differ, based upon opinions specific to individuals.

This report has been presented in accordance with generally accepted environmental assessment practices, based upon the information set forth within the report narrative, for specific application to the proposed Capitol LRT Extension Project in San Jose, California. No warranty, expressed or implied, is made.

The conclusions in this report are qualitative opinions based on limited quantitative information. Soil and groundwater sampling and analysis were not a part of this scope of work. The scope of work was limited to observation of the surface at a specific time, a limited aerial survey review, and environmental database research. Review and evaluations of each specific site were not included in our scope of work. This assessment is not designed to predict future site or off-site conditions. Also, site conditions can differ at locations other than those observed across the Subject Area. Subsurface conditions can differ from those observed on the surface.

This investigation is not a risk assessment and is not intended to provide information needed for public health risk assessment purposes. The consultant has endeavored to determine as much as practical about the site conditions given what we consider to be a reasonable amount of analysis and research time. Additional investigation or sampling and analysis could result in information that would lead to revised conclusions. Additional search can usually turn up more information but frequently with a diminishing rate of information return for the effort spent. The degree of certainty of an environmental assessment is proportional to the time and effort spent. However, the degree of certainty cannot be 100% even with highly detailed exploratory drilling and testing work well beyond the scope of this study.

Respectfully submitted,

PARIKH CONSULTANTS, INC.

Gary Parikh, P.E., G.E.#666
Project Manager

Appendix H

Relevant Land Use Plans and Policies

Introduction

The following discussion summarizes the relevant land use plans and policies pertaining to existing land uses in the Capitol Expressway Corridor. Each of the proposed alternatives was evaluated for its consistency with the following plans and policies in Section 4.13, *Land Use*.

San Jose 2020 General Plan and Land Use/Transportation Map

The City of San Jose (City) governs land use decisions within the Capitol Expressway Corridor. The San Jose 2020 General Plan (City of San Jose 1994) is the framework for guiding land use decisions through goals, policies, and land use designations. The general plan represents the City's assessment of the amount, type, and phasing of development needed to achieve the City's social, economic, and environmental goals. The general plan is based on seven major strategies that support compact, infill, and transit-oriented development (TOD).

The land use/transportation map of the general plan depicts the adopted land use designations within the City's sphere of influence. These designations dictate the general types and intensities of new development and redevelopment at each location. In San Jose, general plan land use designations take precedence over zoning designations when inconsistencies occur (City of San Jose 2001). In addition, any county land that may fall within the City's sphere of influence would be subject to conformance with City policies (Prevetti pers. comm.). Land uses along the corridor are shown in Table H-1.

The general plan has identified locations of TOD corridors, including Capitol Expressway from Interstate 680 to U.S. Highway 101. These corridors are "areas generally suitable for higher residential densities, for more intensive non-residential uses, and for mixed uses; these corridors are centered along existing or planned light rail transit (LRT) lines and/or major bus routes." According to the general plan, the general purpose of the TOD corridor is to

acknowledge the natural tendency toward development intensification in prime urban areas and to channel that development into areas where the intensified uses and public transit will be mutually supportive and will help create vibrant pedestrian oriented neighborhoods.

Relevant Policies

Special Strategy Areas, Transit-Oriented Development Section

Development inconsistent with the objectives of the Transit-Oriented Development Corridors, for instance low intensity uses (e.g. one and two story office buildings), low density residential, and auto related uses (e.g. surface parking lots, automobile sales lots etc.), should be avoided particularly within 2000' of an existing or planned LRT station.

City of San Jose Zoning Ordinance and Map

The zoning ordinance is intended to “guide, control, and regulate future growth and development in the City in a sound and orderly manner, and to promote achievement of the goals and purposes of the San Jose General Plan” (City of San Jose 2001, 2003). The ordinance regulates development standards for properties, including permitted uses. This ordinance is complemented by the zoning maps, which designate various types of land use zoning throughout the City. Zoning designations along the project corridor are summarized in Table H-1.

Communications Hill Specific Plan

The Communications Hill Specific Plan (City of San Jose 1992) outlines the goals and policies for the development of a new 500-acre urbanized residential neighborhood. The southeast portion of the community borders Capitol Expressway. This portion of the planned community is designated as combined industrial/commercial.

Relevant Policies

Transportation Element

Encourage mass transit use by residents through easy access to Light Rail Transit and CalTrain stations.

East Valley/680 and West Evergreen Community Improvement Plans

Community improvement plans are being developed as part of the City's Strong Neighborhoods Initiative. The initiative, a partnership between the City, San Jose Redevelopment Agency, and local neighborhoods, was formed to focus public and private resources on creating high quality neighborhoods. The plans contain goals and action items for making quality of life improvements. Two of these planning areas fall within the project area: the East Valley/680 and West Evergreen Neighborhoods. Both of the plans are currently in draft form but could be approved before the completion of the LRT line.

Relevant Policies

East Valley—Objective of Goal 2

Improve connections within the area so community members can safely and easily travel to work, school, home, and leisure activity destinations.

East Valley—High Priority Improvement Item 5

Soundwalls on Capitol Avenue and Capitol Expressway.

West Evergreen—Action 15

Support the completion of a pedestrian overpass across Capitol Expressway as part of the light rail transit expansion.

Valley Transportation Plan 2020

Valley Transportation Plan 2020 (VTP 2020) (Santa Clara Valley Transportation Authority 2000) was adopted in December 2000 and provides policies and programs for roadways, transit, intelligent transportation systems, bicycle and pedestrian facilities, and land use for Santa Clara County. The plan discusses goals, services, programs, resources, and implementation of transportation improvements. Land use approvals and regulations are authorized by local government. Implementation of Santa Clara Valley Transportation Authority's transportation plans will influence land use densities and patterns. To address this influence, VTP 2020 includes programs to coordinate with local governments regarding land use and transportation decisions.

Relevant Policies

Land Use and Transportation Integration Section

- **Goal:** To provide transportation investments and services that support the maintenance and creation of vibrant urban communities and protect Santa Clara County's natural resources.
 - **Objective:** Concentrate development in cores and community corridors to support alternate modes and maximize productivity of transit investments.
 - **Objective:** Design and manage the transportation system to support concentrated development in selected locations.
 - **Objective:** Use land efficiently and support concentrated development with strategies including: land use intensification and reuse, transportation investments that minimize right-of-way requirements, and limiting land area dedicated to surface parking.

Santa Clara County Airports Master Plan

The Santa Clara County Airports Master Plan (Santa Clara County Airports Department 1982) is used as the basis for future development of Palo Alto, Reid-Hillview, and South County Airports. Reid-Hillview Airport is adjacent to a portion of the Capitol Expressway Corridor. The master plan includes airport activity forecasts, an impact management program, financial characteristics, and an individual examination of each of the three airports. An updated master plan is anticipated to be completed in 2003 (Bennett pers. comm.).

1. INTRODUCTION AND SUMMARY

This report presents a noise and vibration impact assessment for the Capitol Expressway Corridor Light Rail Transit (LRT) Line. This assessment was carried out for the Santa Clara Valley Transportation Authority (VTA) by Harris Miller Miller & Hanson Inc. (HMMH) under subcontract to Jones and Stokes, Inc. The objective of the study was to assess the potential noise and vibration impacts of the planned LRT operations at community locations adjacent to the rail corridor.

The background and results of the assessment are described below. Section 2 provides a discussion of environmental noise and vibration basics, and Section 3 describes the existing noise and vibration conditions and measurement results. The criteria used to assess noise and vibration impact are presented in Section 4, and projections of future noise and vibration conditions are described in Section 5. Section 6 summarizes the impact assessment, and potential mitigation measures are outlined in Section 7. Appendix A includes measurement site photographs, and detailed noise and vibration data are provided in Appendix B and Appendix C, respectively.

1.1 Background

Since 1985, VTA has been operating light rail service within Santa Clara County. The system is 30.5 miles long and has 46 stations. VTA is now proposing to extend the light rail system in the Downtown East Valley area of the City of San Jose.

Planning for a light rail alignment along Capitol Expressway has been ongoing since the mid-1990s. In 1995, Barton-Aschman Associates and DeLeuw, Cather & Company completed the *Capitol Corridor LRT Extension Project* report for what was then known as the Santa Clara County Transportation Agency. The report provided an initial definition of the physical and operational aspects of an extension of the light rail system in the Capitol Corridor. The proposed alignment for the extension began at Hostetter Road and proceeded to the existing transit center at Eastridge Mall (Eastridge Transit Center).

Over time, the portion of the light rail alignment between Wilbur Avenue and the Eastridge Transit Center was removed from the Capitol Avenue light rail project to form the basis of a new, separate, light rail corridor alignment. The Capitol Expressway/Evergreen Corridor would cover an 8-mile alignment from Wilbur Avenue to Highway 87, linking the Capitol Avenue and Guadalupe light rail lines via a connection at the Eastridge Transit Center. In 2000, VTA completed a Major Investment Study (MIS) that identified transportation needs within the community and developed a major transit investment plan for the corridor.

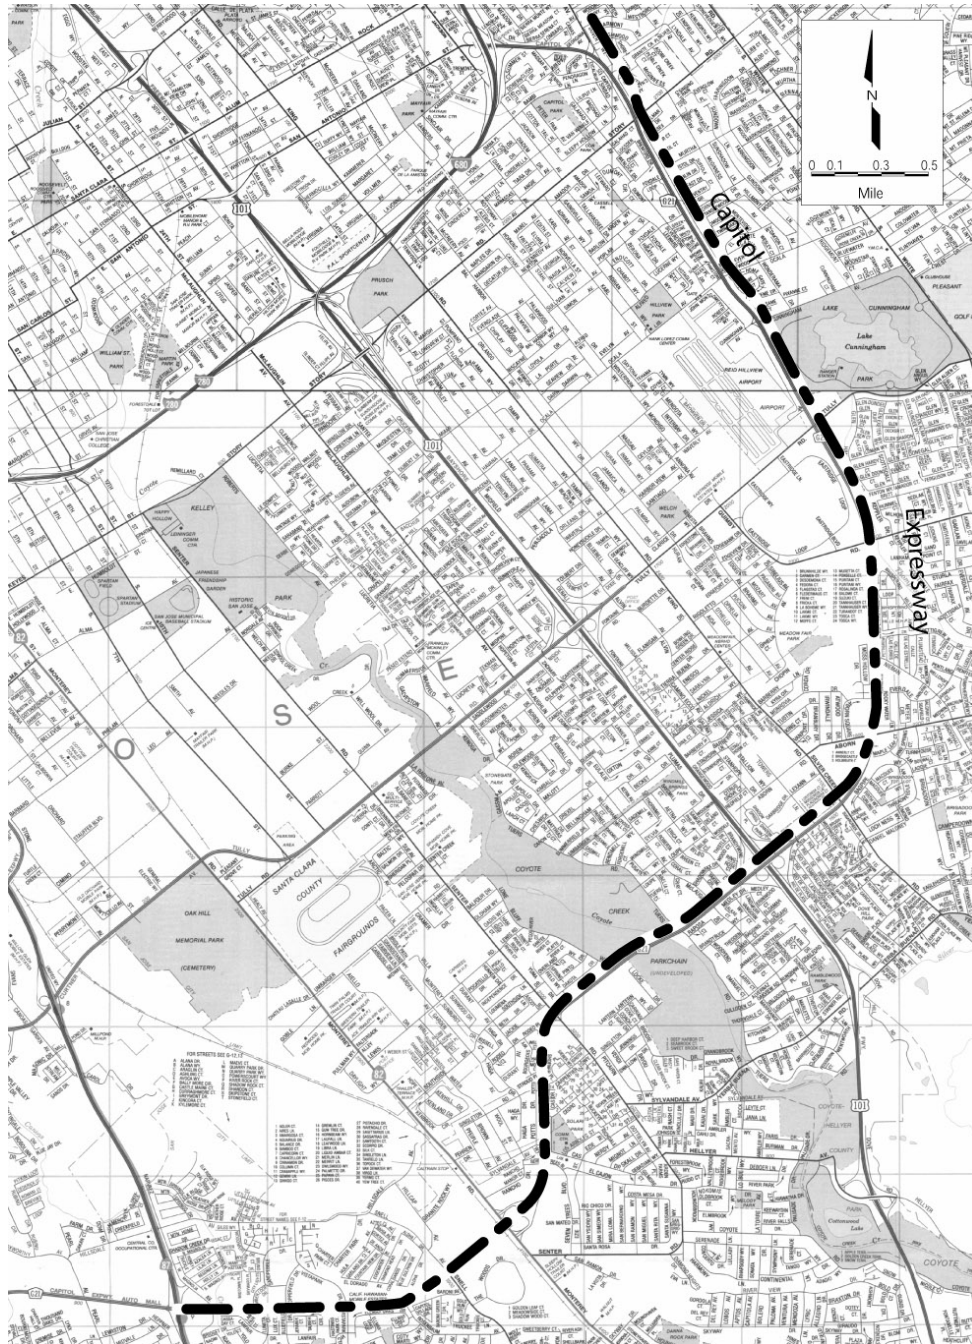

Figure 1. Capitol Expressway LRT Alignment

1.2 Summary of Results

1.2.1 Noise Impact Assessment

The results of the noise analysis indicate that the existing noise environment at locations near the project alignment is dominated by noise from motor vehicle traffic on the Capitol Expressway, general aviation aircraft traffic from Reid-Hillview Airport, commercial aircraft traffic from San Jose International Airport, and general community noise. Based on Federal Transit Administration (FTA) criteria, it is predicted that without mitigation, the proposed LRT operations for the light rail alternative will cause noise impact at a total of 27 residences along the corridor. In addition, Table 1 lists the noise impacts associated with various light rail alternative options.

A number of mitigation measures can be considered for the noise impacts. The most likely method of noise mitigation is noise barriers. In addition, sound insulation treatments may be applied to buildings in areas where barriers would not be effective. These areas are primarily located near grade crossings, where additional noise impact is caused by train horns and grade-crossing bells. The selection of mitigation will depend on more detailed analysis during final design, including input from abutting neighbors. VTA's policy is to provide noise mitigation for severe impacts. A summary of the recommended noise mitigation is provided in Chapter 7.

Table 1. Summary of Noise Impacts

| Option | Number of Impacts | |
|------------------------------------------------------------------------------------------------------|-------------------|--------|
| | Impact | Severe |
| Light Rail Alternative | 27 | 0 |
| Alum Rock Avenue to Story Road | | |
| Capitol Avenue/Capitol Expressway Tunnel/Story Road Aerial Option | 5 | 0 |
| Story Road to Eastridge Transit Center | | |
| Story Road to Ocala Avenue (Tunnel/Aerial Option) | 0 | 0 |
| North of Eastridge Transit Center Tunnel with At-Grade Stn Option | 0 | 0 |
| North of Eastridge Transit Center Tunnel (includes Between Ocala and Cunningham Ave Stn Option) | 0 | 0 |
| North of Eastridge Transit Center Tunnel (includes Cunningham Avenue Station Option) | 0 | 0 |
| Eastridge Transit Center to Aborn Road | | |
| South of Eastridge Transit Center Aerial Crossing Option (only with Eastridge Aerial Station Option) | 0 | 0 |
| South of Eastridge Transit Center Side Running/Tunnel at Nieman Blvd Option | 4 | 0 |
| South of Eastridge Transit Center Side-Running Trench Option | 0 | 0 |
| South of Eastridge Transit Center Side-Running At-Grade/Aerial Option | 0 | 0 |
| Quimby Road to Silver Creek Road | 4 | 0 |
| Quimby Road to Aborn Road | 118 | 4 |
| Aborn Road to Silver Creek Road | | |
| Aerial Crossing at Aborn Road Option | 10 | 0 |
| Silver Creek Road to Coyote Creek | | |
| Aerial Crossing of Hwy 101 Option (includes McLaughlin Aerial Stn) - Silver Creek Rd to U.S. 101 | 0 | 0 |
| U.S. 101 to Tuers Road | 7 | 0 |
| Coyote Creek to Highway 87 | | |
| At-grade, median-running between Coyote Creek and State Route 87 | 4 | 0 |

1.2.2 Vibration Impact Assessment

There are no significant sources of existing vibration along the alignment. Based on Federal Transit Administration (FTA) criteria, it is predicted that without mitigation, the LRT operations for the base alignment will cause vibration impact at a total of 187 residences along the corridor and 51 with the inclusion of shredded tires as a project feature where the vibration levels exceed the impact criterion. In addition, Table 2 lists the vibration and ground-borne noise impacts associated with various alternatives to the base alignment. All of these impacts are related to annoyance effects and not to building damage effects.

There are a number of options available for the mitigation of vibration impacts. The most common method is ballast mats. Ballast mats consist of pads made of rubberlike material placed on an asphalt or concrete base with the normal ballast, ties and rail on top. Because vibration reduction provided by ballast mats is dependent on the frequency content of vibration, they are not always effective at lower frequencies. Relocation of crossovers away from vibration-sensitive receptors would also reduce the vibration impact. Mitigation options will be evaluated in more detail during final design, and the most appropriate measures will be selected based on feasibility, cost effectiveness, and community input. A discussion of the vibration mitigation is included in Chapter 7.

Table 2. Summary of Vibration Impacts

| Option | Ground-Borne Vibration Impacts | Ground-Borne Noise Impacts |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|----------------------------|
| Light Rail Alternative | 187 (51) ¹ | 0 |
| Alum Rock Avenue to Story Road | | |
| Capitol Avenue/Capitol Expressway Tunnel/Story Road Aerial Option | 8 (0) | 14 (0) |
| Story Road to Eastridge Transit Center | | |
| North of Eastridge Transit Center Tunnel with At-Grade Stn Option | 5 (0) | 0 |
| North of Eastridge Transit Center Tunnel (includes Between Ocala and Cunningham Ave Stn Option) | 6 (0) | 0 |
| North of Eastridge Transit Center Tunnel (includes Cunningham Avenue Station Option) | 4 (0) | 0 |
| Eastridge Transit Center to Aborn Road | | |
| South of Eastridge Transit Center Aerial Crossing Option (only with Eastridge Aerial Station Option) | 8 (8) | 0 |
| South of Eastridge Transit Center Side Running/Tunnel at Nieman Blvd Option | 107 (24) | 66 (25) |
| South of Eastridge Transit Center Side-Running Trench Option | 10 (0) | 0 |
| South of Eastridge Transit Center Side-Running At-Grade/Aerial Option | 119 (26) | 120 (60) |
| Quimby Road to Aborn Road | 0 | 0 |
| Quimby Road to Aborn Road | 4 (0) | 0 |
| Aborn Road to Silver Creek Road | | |
| Aerial Crossing at Aborn Road Option | 0 | 0 |
| Silver Creek Road to Coyote Creek | | |
| Aerial Crossing of Hwy 101 Option (includes McLaughlin Aerial Stn) - Silver Creek Rd to U.S. 101 | 0 | 0 |
| U.S. 101 to Tuers Road | 0 | 0 |
| Coyote Creek to Highway 87 | | |
| At-grade, median-running between Coyote Creek and State Route 87 | 22 (4) | 0 |
| 1. The numbers of vibration and ground-born noise impacts in parenthesis assume that shredded tires are a project feature where the vibration levels and ground-borne noise levels exceed the impact criteria. | | |

2. ENVIRONMENTAL NOISE AND VIBRATION BASICS

2.1 Noise Fundamentals and Descriptors

Noise is typically defined as unwanted or undesirable sound, where sound is characterized by small air pressure fluctuations above and below the atmospheric pressure. The basic parameters of environmental noise that affect human subjective response are (1) intensity or level, (2) frequency content and (3) variation with time. The first parameter is determined by how greatly the sound pressure fluctuates above and below the atmospheric pressure, and is expressed on a compressed scale in units of decibels. By using this scale, the range of normally encountered sound can be expressed by values between 0 and 120 decibels. On a relative basis, a 3-decibel change in sound level generally represents a barely-noticeable change outside the laboratory, whereas a 10-decibel change in sound level would typically be perceived as a doubling (or halving) in the loudness of a sound.

The frequency content of noise is related to the tone or pitch of the sound, and is expressed based on the rate of the air pressure fluctuation in terms of cycles per second (called Hertz and abbreviated as Hz). The human ear can detect a wide range of frequencies from about 20 Hz to 17,000 Hz. However, because the sensitivity of human hearing varies with frequency, the A-weighting system is commonly used when measuring environmental noise to provide a single number descriptor that correlates with human subjective response. Sound levels measured using this weighting system are called "A-weighted" sound levels, and are expressed in decibel notation as "dBA." The A-weighted sound level is widely accepted by acousticians as a proper unit for describing environmental noise. To indicate what various noise levels represent, Figure 2 provides a comparison of representative noise levels for common noise sources and environments. While the extremes of noise are shown to range from 0 dBA (approximate threshold of hearing) to 120 dBA (jet aircraft at 500 feet), most commonly encountered noise levels are shown to fall within the range of 40 dBA to 90 dBA.

Because environmental noise fluctuates from moment to moment, it is common practice to condense all of this information into a single number, called the "equivalent" sound level (Leq). Leq can be thought of as the steady sound level that represents the same sound energy as the varying sound levels over a specified time period (typically 1 hour or 24 hours). Often the Leq values over a 24-hour period are used to calculate cumulative noise exposure in terms of the Day-Night Sound Level (Ldn). Ldn is the A-weighted Leq for a 24-hour period with an added 10-decibel penalty imposed on noise that occurs during the nighttime hours (between 10 P.M. and 7 A.M.). Many surveys have shown that Ldn is well correlated with human annoyance, and therefore this descriptor is widely used for environmental noise impact assessment. Figure 3 provides examples of typical noise environments and criteria in terms of Ldn. While the extremes of Ldn are shown to range from 35 dBA in a wilderness environment to 85 dBA in noisy urban environments, Ldn is generally found to range between 55 dBA and 75 dBA in most communities. As shown in Figure 3, this spans the range between an "ideal" residential environment and the threshold for an unacceptable residential environment according to U.S. Federal agency criteria.

Environmental noise can also be viewed on a statistical basis using percentile sound levels, Ln, which refer to the sound level exceeded "n" percent of the time. For example, the sound level exceeded 90 percent of the time, denoted as L90, is often taken to represent the "background" noise in a community. Similarly, the sound level exceeded 33 percent of the time (L33) is often used to approximate the Leq in the absence of loud, intermittent sources such as aircraft and trains.

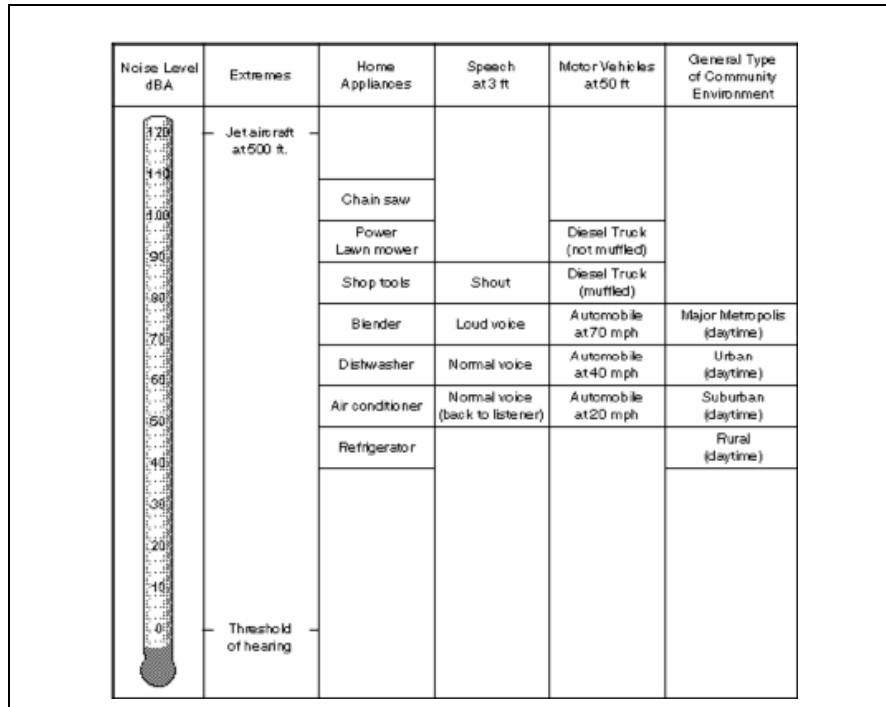

Figure 2. Comparison of Various Noise Levels

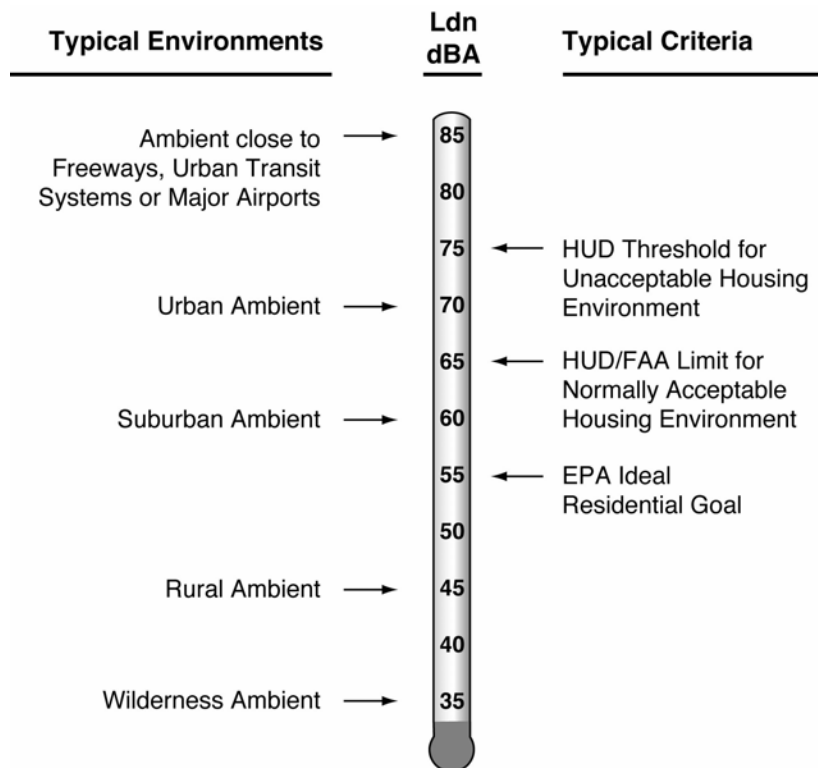

Figure 3. Examples of Typical Outdoor Noise Exposure

2.2 Vibration Fundamentals and Descriptors

Ground-borne vibration is the oscillatory motion of the ground about some equilibrium position, which can be described in terms of displacement, velocity or acceleration. Displacement refers to the distance an object moves away from its equilibrium position, velocity refers to the rate of change in displacement or the speed of this motion, and acceleration refers to the time rate of change in the velocity of the object. At any given frequency of oscillation, vibration displacement, velocity and acceleration are related by a constant factor. However, vibrations are often more complex in the environment, including components at many different frequencies. Therefore, the relationship between the overall vibration levels in terms of these descriptors depends on the frequency content of the vibration energy.

Although displacement is easier to understand than velocity or acceleration, it is rarely used for describing ground-borne vibration. One reason for this is that most sensors used for measuring ground-borne vibration are designed to provide output signals proportional to either velocity or acceleration. Even more important, the response of humans, buildings and equipment to vibration is more accurately described using velocity or acceleration. Because sensitivity to vibration has typically been found to correspond to a constant level of vibration velocity amplitude within the low frequency range of most concern for environmental vibration (roughly 5-100 Hz), vibration velocity is used in this analysis as the primary measure to evaluate the effects of vibration.

There are several different measures used to quantify vibration amplitude. One of the most common is the peak particle velocity (PPV), defined as the maximum instantaneous positive or negative peak of the vibratory motion. PPV is often used in monitoring blasting vibration since it is related to the stresses experienced by building components. Although PPV is appropriate for evaluating the potential for building damage, it is less suitable for evaluating human response, which is better related to an average vibration amplitude. Because the net average of a vibration signal about its equilibrium position is zero, the root mean square (rms) amplitude is often used to describe the "smoothed" vibration amplitude. The rms amplitude is defined as the average of the squared amplitude of the signal, and is typically evaluated over a one-second period of time.

Although vibration velocity is normally described in units of inches per second in the USA, the decibel notation, which acts to compress the range of numbers required to describe vibration, can also be used. In this notation, the vibration magnitude can be expressed in terms of velocity level, in decibels, defined as follows:

$$L_v = 20 \log_{10}(v/v_{ref}), \text{ VdB} \quad \text{where: } v = \text{rms velocity, in./sec}$$
$$v_{ref} = 1 \times 10^{-6} \text{ in./sec}$$

Thus, the descriptor used for this assessment of ground-borne vibration is the rms vibration velocity level, L_v , expressed in decibels (VdB) relative to one micro-inch per second. Figure 4 illustrates typical ground-borne vibration levels for common sources as well as criteria for human and structural response to ground-borne vibration. As shown, the range of interest is from approximately 50 VdB to 100 VdB, from imperceptible background vibration to the threshold of damage. Although the threshold of human perception to vibration is approximately 65 VdB, annoyance is not usually significant unless the vibration exceeds 70 VdB.

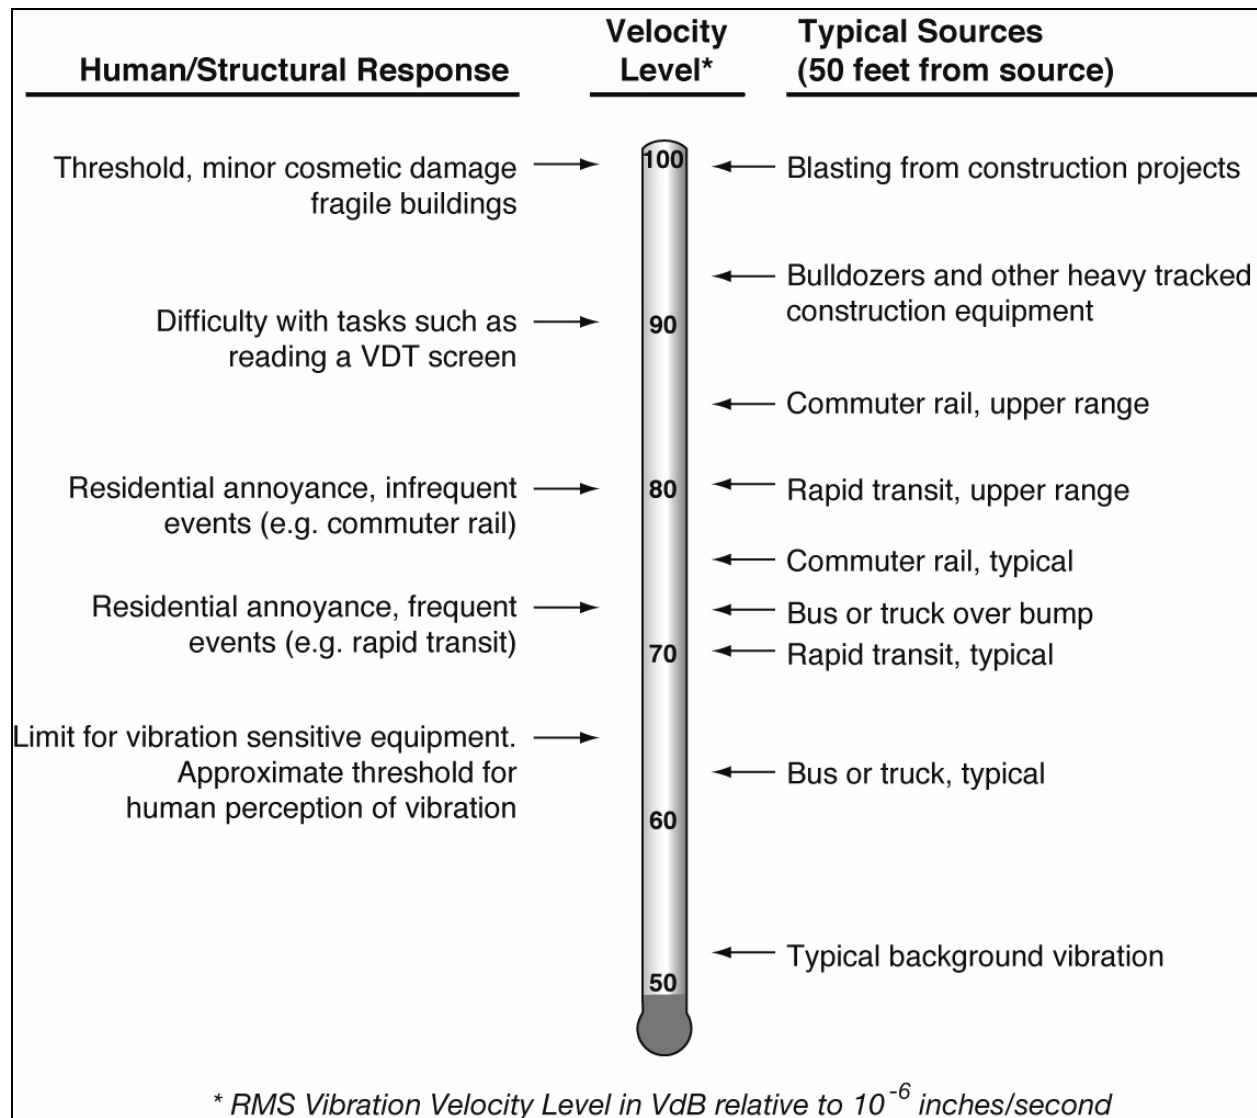

Figure 4. Typical Ground-Borne Vibration Levels and Criteria

3. EXISTING CONDITIONS

The primary sources that contribute to the existing noise environment along the Capitol Expressway Corridor are motor vehicle traffic on the Capitol Expressway, general aviation aircraft traffic from Reid-Hillview Airport, commercial aircraft traffic from San Jose International Airport, and general community activities. There are no significant sources of existing ground-borne vibration along the project corridor.

To characterize the existing baseline noise and vibration conditions in the communities along the corridor, a field measurement program was carried out during October and November 2001 and from March 10 to 12, 2003. The weather during much of this period was characterized by warm temperatures with conditions ranging from overcast to sunny.

The measurement program included monitoring of existing noise levels, as well as tests to characterize ground-borne vibration propagation at representative sites. The measurement locations, test procedures and results are described separately below for noise and for vibration.

3.1 Noise Measurements

3.1.1 Locations

Noise measurement sites were selected based on a review of aerial photographs, supplemented by a visual land-use survey of noise-sensitive receptors along the Capitol Expressway Corridor. Sixteen sites, designated as Sites N-1 through N-16, were selected for long-term (typically 24-hour) monitoring. The locations of these measurement sites are indicated in Figure 5, and are described below. Site photographs are included in Appendix A.

Site N-1: 4268 Bambi Lane. Site N1 was located west of the proposed alignment, at 4268 Bambi Lane. The microphone was located in the yard of the single-family residence, on the corner of Bambi Lane and South Capitol Avenue. Traffic on the Capitol Expressway was the dominant source of noise at this site.

Site N-2: 1276 Capitol Court. Site N2 was located east of the proposed alignment, at 1276 Capitol Court. The microphone was located in the yard of the single-family residence, on the corner of Capitol Court and South Capitol Avenue, a frontage road to the Capitol Expressway. Dominant sources of noise at this site included traffic on the Capitol Expressway and general aviation aircraft from the Reid-Hillview Airport.

Site N-3: 2540 Greenstone Circle. Site N3 was located at 2540 Greenstone Circle, west of the proposed alignment. The microphone was located in the backyard of the single-family residence at the end of Greenstone Circle abutting the Capitol Expressway. Traffic on the Capitol Expressway and general aviation aircraft from the Reid-Hillview Airport contributed to the noise environment. An 8-foot high sound wall separates these residences from the Capitol Expressway.

Site N-4: 2015 Supreme Drive. Site N4 was located at 2015 Supreme Drive, east of the proposed alignment. The microphone was placed in the backyard of a single-family residence abutting the Capitol Expressway. Traffic on the Capitol Expressway and general aviation aircraft from the Red-Hillview Airport contributed to the noise environment. A 6- to 8-foot high sound wall separates this neighborhood from the Capitol Expressway.

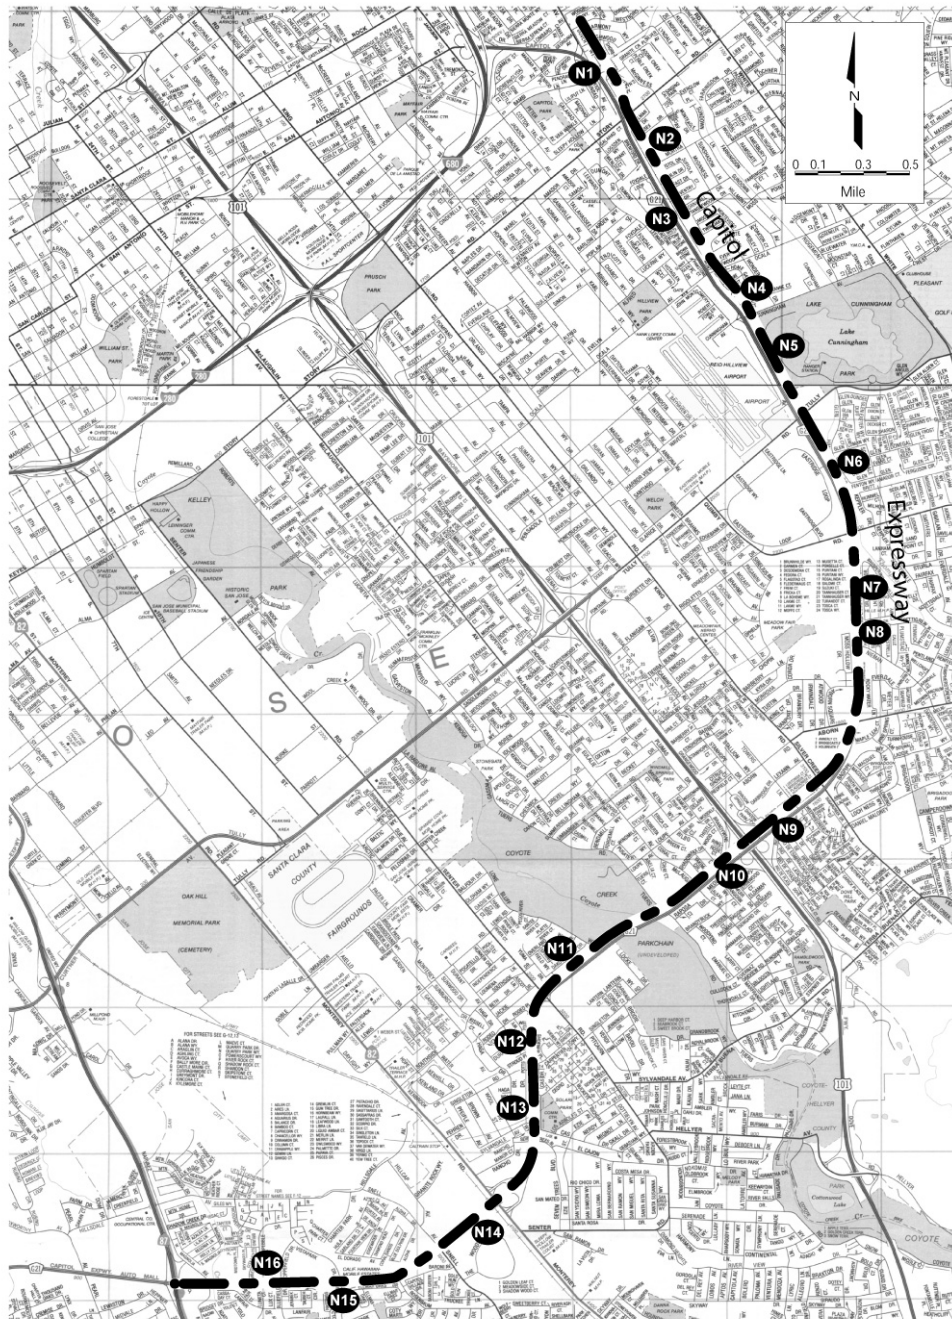

Figure 5. Existing Ambient Noise Measurement Locations

Site N-5: Lake Cunningham Park. Site N5 was located at Lake Cunningham Park east of the proposed alignment. The microphone was located approximately 20 feet behind an earth berm that separates the site from the Capitol Expressway. Noise sources at this site included traffic on the Capitol Expressway, aircraft activities associated with San Jose International Airport and general aviation aircraft.

Site N-6: 2655 Glen Hanleigh Drive. Site N6 was located east of the proposed alignment, at 2655 Glen Hanleigh Drive on the corner of Glen Hanleigh Drive, a frontage road to the Capitol Expressway, and Glen Doon Court. The microphone was located in the yard of the single-family residence. Traffic on the Capitol Expressway dominated the noise environment.

Site N-7: 2561 Whispering Hills Drive. Site N7 was located at 2561 Whispering Hills Drive, east of the proposed alignment. The microphone was located in the yard between two trailer homes at 2561 and 2562 Whispering Hills Drive. A sound wall approximately 8-10 feet high separates these homes from the Capitol Expressway. Traffic on the Capitol Expressway dominated the noise environment.

Site N-8: 2219 Pettigrew Drive. Site N8 was located at 2219 Pettigrew Drive east of the proposed alignment. The microphone was located in the backyard of the single-family residence, separated from the Capitol Expressway by an 8-foot sound wall. Noise sources at this site included traffic on the Capitol Expressway and general aviation aircraft approaching and departing from the Reid-Hillview Airport.

Site N-9: 5 Rio De Plata. Site N9 was located at 5 Rio De Plata, east of the proposed alignment and northeast of the intersection of U.S. Route 101 and the Capitol Expressway. The microphone was placed in the backyard of a single-family residence abutting the Capitol Expressway. Traffic from the Capitol Expressway and Route 101 contributed to the noise environment at this site. A 10-foot sound wall separates these residences from the Capitol Expressway and an off ramp from Route 101 to the Expressway.

Site N-10: 1275 Medley Drive. Site N10 was located at 1275 Medley Drive, east of the proposed alignment and southwest of the intersection of U.S. Route 101 and the Capitol Expressway. The microphone was located in the backyard of a single-family residence abutting the Capitol Expressway. An 8-foot sound wall separates the residences and the Capitol Expressway. The noise environment at this site is dominated by traffic on the Capitol Expressway.

Site N-11: 3211/3205 Lone Bluff Way. Site N11 was located at 3211/3205 Lone Bluff Way west of the proposed alignment. The microphone was located in the yard between two single-family residences. Traffic on the Capitol Expressway was the dominant source of noise at this site.

Site N-12: 3180 Welby Court. Site N12 was located at 3180 Welby Court, west of the proposed alignment. The microphone was located in the yard of a single-family residence, approximately 10 feet from a 6-foot sound wall that separates this neighborhood from the Capitol Expressway. Traffic on the Capitol Expressway and airplanes contribute to the noise environment.

Site N-13: 13184 Potts Drive. Site N13 was located at 13184 Potts Drive, west of the proposed alignment. The microphone was placed in the backyard of a single-family residence abutting the Capitol Expressway. Traffic on the Capitol Expressway dominated the noise environment. An 8-foot sound wall separates this neighborhood from the Expressway.

Site N-14: 916 The Woods Drive. Site N14 was located at 916 The Woods Drive east of the proposed alignment. The microphone was located on a second floor balcony. Noise sources at this site included traffic on the Capitol Expressway and Caltrain and Amtrak trains on the nearby train tracks.

Site N-15: 4111 Ellmar Oaks Drive. Site N15 was located at 4111 Ellmar Oaks Drive at the intersection of the Capitol Expressway and Vista Park east of the proposed alignment. The microphone was located on a second floor balcony facing Vista Park. Dominant noise sources at this site were the Capitol Expressway and Vista Park Drive.

Site N-16: 611 Copperfield Drive. Site N16 was located at 611 Copperfield Drive on the corner of Copperfield and Capitol Expressway west of the proposed alignment. The microphone was located on a third floor balcony. Traffic on the Capitol Expressway was the dominant source of noise at this site.

3.1.2 Instrumentation and Procedures

Long-term, ambient noise measurements were conducted at Sites N-1 through N-16, described above. At these locations, unattended Larson Davis Model 870 portable, automatic noise monitors were used to continuously sample the A-weighted sound level (with slow response), typically over one 24-hour period. The noise monitors were programmed to record hourly results, including the maximum sound level (L_{max}), the equivalent sound level (Leq) and the statistical percentile sound levels (Ln). The day-night equivalent sound level (L_{dn}) was subsequently computed from the hourly Leq data.

The noise measurement equipment described above conforms to ANSI Standard S1.4 for Type 1 (Precision) sound level meters. Calibrations, traceable to the U.S. National Institute of Standards and Technology (NIST) were carried out in the field before and after each set of measurements using acoustical calibrators.

In all cases, the measurement microphone was protected by a windscreen, and supported on a tripod at a height of 4 to 6 feet above the ground. Furthermore, the microphone was positioned to characterize the exposure of the site to the dominant noise sources in the area. For example, microphones were located at the approximate setback lines of the receptors from the Capitol Expressway, and were positioned to avoid acoustic shielding by landscaping, fences or other obstructions.

3.1.3 Results

A summary of the existing ambient noise measurement results is provided in Table 3, and detailed data are included in Appendix B.

Table 3. Summary of Existing Ambient Noise Measurement Results

| Site No. | Measurement Location Description | Start of Measurement | | Meas. Time (hrs) | Noise Exposure (dBA) | |
|----------|-----------------------------------------|----------------------|-------|------------------|----------------------|-----|
| | | Date | Time | | Ldn | Leq |
| N-1 | S.F. Res. @ 4268 Bambi Lane | 10-31-01 | 12:27 | 24 | 72 | -- |
| N-2 | S.F. Res. @ 1276 Capitol Court | 10-31-01 | 13:16 | 24 | 73 | -- |
| N-3 | S.F. Res. @ 2540 Greenstone Circle | 10-31-01 | 14:10 | 24 | 67 | -- |
| N-4 | S.F. Res. @ 2015 Supreme Drive | 10-31-01 | 13:40 | 24 | 65 | -- |
| N-5 | San Jose Lake Cunningham Park | 11-01-01 | 15:00 | 24 | 59 | -- |
| N-6 | S.F. Res. @ 2655 Glen Hanleigh Drive | 10-30-01 | 13:30 | 24 | 65 | -- |

| N-15 | S.F. Res. @ 4111 Ellmar Oaks Drive | 10-29-01 | 11:12 | 24 | 72 | -- |
| N-16 | S.F. Res. @ 611 Copperfield Drive | 10-29-01 | 10:43 | 24 | 75 | -- |

The long-term measurement results in Table 3 indicate Ldn's ranging from 59 dBA to 75 dBA along the corridor. These results were used as a basis for determining the existing noise conditions at all noise-sensitive receptors along the Capitol Expressway Corridor.

Along the east side of the alignment the existing noise levels were estimated to be the following, based on the long-term noise monitoring sites presented in Table 3:

North End of Alignment to Ocala Avenue: The Ldn was estimated to be 73 dBA, based on long-term noise measurement site N-2.

Ocala Avenue to Cunningham Avenue: The Ldn was estimated to be 65 dBA, based on long-term noise measurement site N-4.

Quimby Road to Nieman Boulevard: The Ldn was estimated to be 66 dBA, based on long-term noise measurement site N-7.

Nieman Boulevard to Aborn Road: The Ldn was estimated to be 67 dBA, based on long-term noise measurement site N-8.

Aborn Road to US101: The Ldn was estimated to be 69 dBA, based on long-term noise measurement site N-9.

US101 to Tuers Road: The Ldn was estimated to be 64 dBA, based on long-term noise measurement site N-10.

Tuers Road to Monterrey Highway: The Ldn was estimated to be 73 dBA, based on long-term noise measurement site N-11.

Monterrey Highway to Snell Avenue: The Ldn was estimated to be 65 dBA, based on long-term noise measurement site N-14.

Snell Avenue to End of Alignment: The Ldn was estimated to be 72 dBA, based on long-term noise measurement site N-15.

Along the west side of the alignment the existing noise levels were estimated to be the following, based on the long-term noise monitoring sites presented in Table 3:

Start of Alignment to Story Road: The Ldn was estimated to be 72 dBA, based on long-term noise measurement site N-1.

Story Road to Ocala Avenue: The Ldn was estimated to be 67 dBA, based on long-term noise measurement site N-3.

Quimby Road to Aborn Road: The Ldn was estimated to be 67 dBA, based on long-term noise measurement site N-8.

Aborn Road to US101: The Ldn was estimated to be 69 dBA, based on long-term noise measurement site N-9.

US101 to McLaughlin Avenue: The Ldn was estimated to be 64 dBA, based on long-term noise measurement site N-10.

Tuers Road to Senter Road: The Ldn was estimated to be 73 dBA, based on long-term noise measurement site N-11.

Senter Road to Singleton Road: The Ldn was estimated to be 66 dBA, based on long-term noise measurement site N-12.

Singleton Road to Monterrey Highway: The Ldn was estimated to be 63 dBA, based on long-term noise measurement site N-13.

Vista Park Drive to South End of Alignment: The Ldn was estimated to be 75 dBA, based on long-term noise measurement site N-16.

3.2 Vibration Measurements

3.2.1 Locations and Tests

Vibration measurement test sites were selected based on a review of aerial photographs, supplemented by a visual land-use survey. Four sites, designated as Sites V-1 through V-4, were originally selected to represent a range of soil conditions in areas along the rail corridor that include a significant number of vibration-sensitive receptors. The locations of these measurement sites are indicated in Figure 6, and are described below. Site photographs are included in Appendix A.

Site V-1: Ryan Elementary School. Site V1 was located east of the proposed alignment at the Ryan Elementary School adjacent to a baseball diamond. Several neighborhoods are located in the vicinity of this measurement site. This site is representative of the vibration-sensitive receptors in the northern portion of the proposed alignment.

Site V-2: East Ridge Mall. Site V2 was located west of the proposed alignment at the East Ridge Mall and a VTA bus station. The measurements were performed just south of the intersection of the Capitol Expressway and Tully Road. This site is representative of vibration-sensitive receptors in the vicinity of Tully Road.

Site V-3: Brandybuck Way and Woody End Court. Site V3 was located east of the proposed alignment at the intersection of Brandybuck Way and Woody End Court. This site is representative of vibration-sensitive receptors north of Coyote Creek Parkchain.

Site V-4: Solari Park. Site V4 was located east of the proposed alignment at Solari Park near a baseball field. This site is representative of vibration-sensitive sites in the southern portion of the proposed alignment.

3.2.2 Instrumentation and Procedures

The ground vibration measurements were made with high-sensitivity accelerometers mounted in the vertical direction on either paved surfaces, or on top of steel stakes driven into soil. The acceleration signals were recorded on a TEAC Model RD-130-TE 8-channel digital audio tape (DAT) recorder and subsequently analyzed in the HMMH laboratory.

The vibration propagation test procedure is shown schematically in Figure 7. As shown in the cross section view at the top, the test basically consists of dropping a 60 lb weight from a height of 3 to 4 feet onto the ground. A load cell is used to measure the force of the impact and accelerometers are used to measure the resulting vibration pulses at various distances from the ground. The relationship between the input force and the ground surface vibration, called the transfer mobility, characterizes vibration propagation at this location. It is possible to estimate the ground vibration that would be caused by another source, such as a train, by substituting the impact force with the train forces.

The bottom sketch in Figure 7 shows how the dropped weight point source is used to simulate a line vibration source such as a train. Impact tests are made at regular intervals in a line along the rail alignment. For these tests, impacts were done at eleven points, spaced 15 feet apart along a line perpendicular to the line of accelerometers.

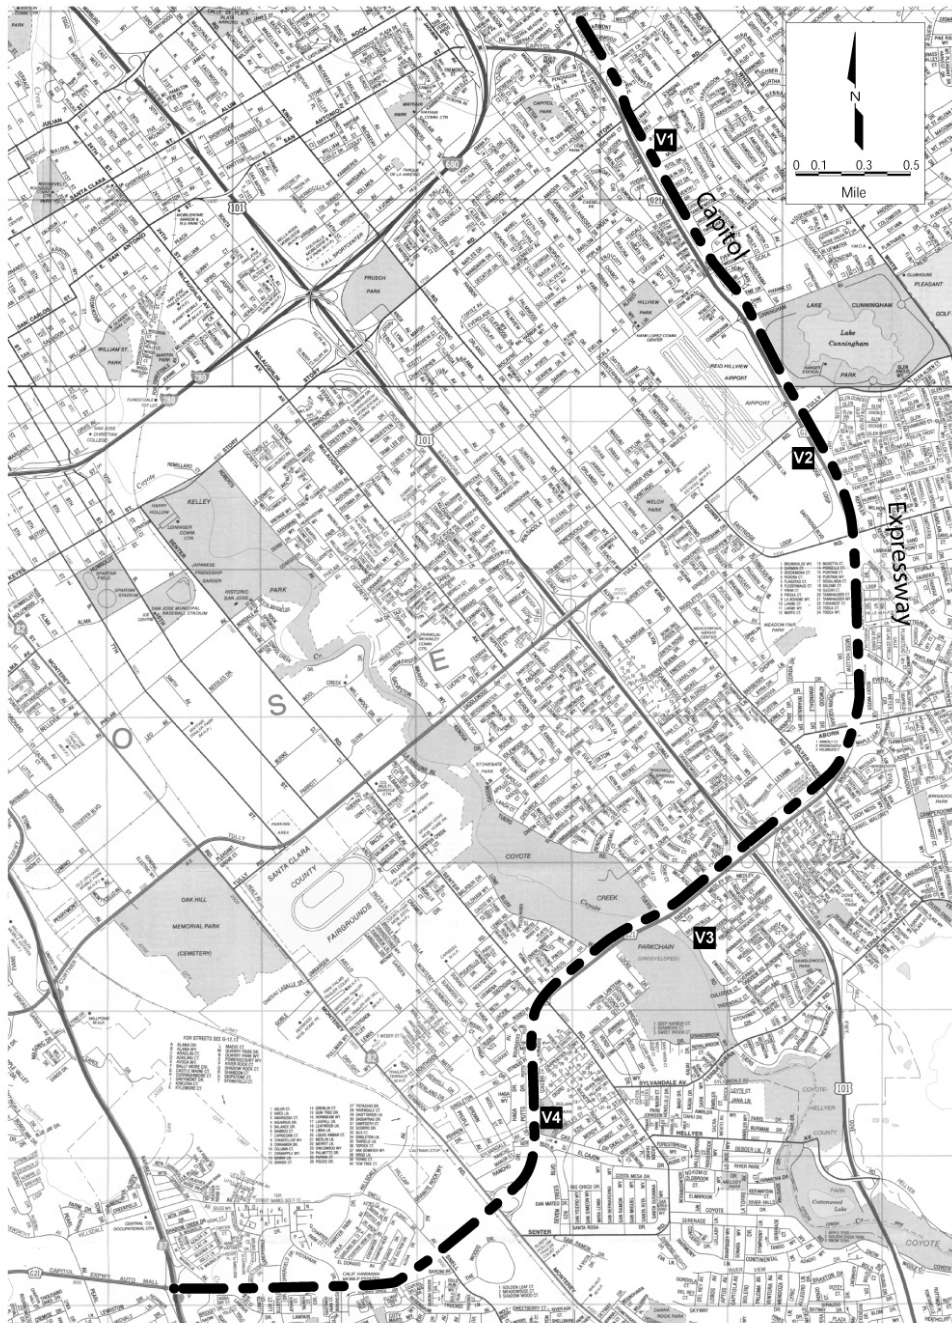

Figure 6. Vibration Measurement Test Locations

Cross Section of Vibration Propagation Test Procedure

Plan View of Vibration Propagation Test Procedure

Figure 7. Vibration Propagation Test Procedure

3.2.3 Results

For laboratory analysis of the ground vibration propagation test data, a Tektronix Model 2630 multi-channel spectrum analyzer was used to obtain the transfer mobility relationship for each accelerometer/impact pair. The basic steps taken to calculate 1/3-octave band transfer functions are summarized below:

1. A multi-channel spectrum analyzer was used to get narrowband transfer functions. A minimum of 20 impacts was used to obtain signal-enhanced transfer functions for each impact site-accelerometer pair. Numerical integration was used to change from acceleration to velocity.
2. The 1/3-octave band transfer mobility was calculated for each accelerometer/impact pair.
3. Each set of 1/3-octave band point-source transfer mobilities was combined using Simpson's Rule for numerical integration to estimate the equivalent line-source transfer mobility.
4. For each 1/3-octave band, a smooth curve was fit to the line source transfer mobility values. The end result is an estimate of line source transfer mobility as a function of distance from the source.

Examples of the resulting smoothed line source transfer mobilities are given in Figure 8, which provides spectra at a distance of 100 feet for each of the four test sites. The results suggest that for equal vibration input at all frequencies, the ground vibration response peaks at 31.5 Hz for Site V-2, at 20 Hz for Sites V-1 and V-3, and at 12.5 Hz for Site V-4. More details on the propagation test and analysis procedures are given the U. S. Federal Transit Administration (FTA) guidance manual *Transit Noise and Vibration Impact Assessment* (FTA Report DOT-T-95-16, April 1995). Detailed test data for the Capitol Expressway Corridor are included in Appendix C of this report.

Figure 8. Line Source Transfer Mobilities for Capitol Expressway Corridor Sites

4. NOISE AND VIBRATION IMPACT CRITERIA

Experience suggests that noise and vibration can be major public concerns with regard to the effects of a rail transit project. This section summarizes the impact limits as applicable to the Capitol Expressway Corridor Project.

4.1 Transit Noise Criteria

Noise impact for this project is based on the criteria defined in the U. S. Federal Transit Administration (FTA) guidance manual *Transit Noise and Vibration Impact Assessment* (FTA Report DOT-T-95-16, April 1995). The FTA noise impact criteria are founded on well-documented research on community reaction to noise and are based on change in noise exposure using a sliding scale. Although more transit noise is allowed in neighborhoods with high levels of existing noise, smaller increases in total noise exposure are allowed with increasing levels of existing noise.

The FTA Noise Impact Criteria group noise sensitive land uses into the following three categories:

- Category 1: Buildings or parks where quiet is an essential element of their purpose.
- Category 2: Residences and buildings where people normally sleep. This includes residences, hospitals, and hotels where nighttime sensitivity is assumed to be of utmost importance.
- Category 3: Institutional land uses with primarily daytime and evening use. This category includes schools, libraries, churches and active parks.

Ldn is used to characterize noise exposure for residential areas (Category 2). For other noise sensitive land uses, such as outdoor amphitheaters and school buildings (Categories 1 and 3), the maximum 1-hour Leq during the facility's operating period is used.

There are two levels of impact included in the FTA criteria. The interpretation of these two levels of impact is summarized below:

Severe: Severe noise impacts are considered "significant" as this term is used in the National Environmental Policy Act (NEPA) and implementing regulations. Noise mitigation will normally be specified for severe impact areas unless there is no practical method of mitigating the noise.

Impact: In this range of noise impact, sometimes referred to as moderate impact, other project-specific factors must be considered to determine the magnitude of the impact and the need for mitigation. These other factors can include the predicted increase over existing noise levels, the types and number of noise-sensitive land uses affected, existing outdoor-indoor sound insulation, and the cost effectiveness of mitigating noise to more acceptable levels.

The noise impact criteria are summarized in Table 4. The first column shows the existing noise exposure and the remaining columns show the additional noise exposure from the transit project that would cause either moderate or severe impact. The future noise exposure would be the combination of the existing noise exposure and the additional noise exposure caused by the transit project. Table 5 gives the

information from Table 4 in terms of the allowable increase in cumulative noise exposure (noise from existing sources plus project noise) as a function of existing noise exposure. As the existing noise exposure increases, the amount that the rail project can increase the overall noise exposure before there is impact decreases.

Table 4. FTA Noise Impact Criteria

| Existing Noise Exposure Leq or Ldn | Project Noise Exposure Impact Thresholds, Leq or Ldn (dBA) | | | |
|---------------------------------------|------------------------------------------------------------|---------------|------------------|---------------|
| | Category 1 or 2 Sites | | Category 3 Sites | |
| | Impact | Severe Impact | Impact | Severe Impact |

| 74 | 0.5 | 2 | 1.5 | 5 |
| 75 | 0.4 | 2 | 1.2 | 5 |

Note: Ldn is used for land uses where nighttime sensitivity is a factor;
maximum 1-hour Leq is used for land use involving only daytime activities.

4.2 Transit Vibration Criteria

The FTA ground-borne vibration impact criteria are based on land use and train frequency, as shown in Table 6. There are some buildings, such as concert halls, recording studios and theaters, which can be very sensitive to vibration but do not fit into any of the three categories listed in Table 6. Due to the sensitivity of these buildings, they usually warrant special attention during the environmental assessment of a transit project. Table 7 gives criteria for acceptable levels of ground-borne vibration for various types of special buildings.

It should also be noted that Tables 6 and 7 include separate FTA criteria for ground-borne noise, the “rumble” that can be radiated from the motion of room surfaces in buildings due to ground-borne vibration. Although expressed in dBA, which emphasizes the more audible middle and high frequencies, the criteria are set significantly lower than for airborne noise to account for the annoying low-frequency character of ground-borne noise. Because airborne noise often masks ground-borne noise for above ground (i.e. at-grade or elevated) rail systems, ground-borne noise criteria are primarily applied to subway operations where airborne noise is not a factor. For the above-grade sections of the Capitol Expressway Corridor, ground-borne noise criteria are applied only to buildings that have sensitive interior spaces that are well insulated from exterior noise.

Table 6. Ground-Borne Vibration and Noise Impact Criteria by Land Use Category

| Land Use Category | Ground-Borne Vibration Impact Levels (VdB re 1 micro-inch/sec) | | Ground-Borne Noise Impact Levels (dB re 20 micro Pascals) | |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|--------------------------------|-----------------------------------------------------------|--------------------------------|
| | Frequent Events ¹ | Infrequent Events ² | Frequent Events ¹ | Infrequent Events ² |
| Category 1: Buildings where low ambient vibration is essential for interior operations. | 65 VdB ³ | 65 VdB ³ | - ⁴ | - ⁴ |
| Category 2: Residences and buildings where people normally sleep. | 72 VdB | 80 VdB | 35 dBA | 43 dBA |
| Category 3: Institutional land uses with primarily daytime use. | 75 VdB | 83 VdB | 40 dBA | 48 dBA |
| Notes: 1. “Frequent Events” is defined as more than 70 vibration events per day. Most transit projects fall into this category. 2. “Infrequent Events” is defined as fewer than 70 vibration events per day. This category includes most commuter rail systems. 3. This criterion limit is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes. Vibration sensitive manufacturing or research will require detailed evaluation to define the acceptable vibration levels. Ensuring lower vibration levels in a building often requires special design of the HVAC systems and stiffened floors. 4. Vibration-sensitive equipment is not sensitive to ground-borne noise. | | | | |

Table 7. Ground-Borne Vibration and Noise Impact Criteria for Special Buildings

| Type of Building or Room | Ground-Borne Vibration Impact Levels (VdB re 1 micro-inch/sec) | | Ground-Borne Noise Impact Levels (dB re 20 micro Pascals) | |
|--------------------------|-------------------------------------------------------------------|--------------------------------|--------------------------------------------------------------|--------------------------------|
| | Frequent Events ¹ | Infrequent Events ² | Frequent Events ¹ | Infrequent Events ² |
| Concert Halls | 65 VdB | 65 VdB | 25 dBA | 25 dBA |
| TV Studios | 65 VdB | 65 VdB | 25 dBA | 25 dBA |
| Recording Studios | 65 VdB | 65 VdB | 25 dBA | 25 dBA |
| Auditoriums | 72 VdB | 80 VdB | 30 dBA | 38 dBA |
| Theaters | 72 VdB | 80 VdB | 35 dBA | 43 dBA |

Notes:

1. “Frequent Events” is defined as more than 70 vibration events per day. Most transit projects fall into this category.
2. “Infrequent Events” is defined as fewer than 70 vibration events per day. This category includes most commuter rail systems.
3. If the building will rarely be occupied when the trains are operating, there is no need to consider impact. As an example consider locating a commuter rail line next to a concert hall. If no commuter trains will operate after 7 pm, it should be rare that the trains interfere with the use of the hall.

4.3 Noise Criteria for Ancillary Equipment

The FTA Guidance Manual does not include any limits that are specifically applicable to substation noise. Common limits for this type of noise in residential areas is 10 dBA over the minimum hourly L90 (the sound level exceeded 90 percent of the time) or a maximum of 45 dBA at any residence, whichever is the most stringent.

4.4 Construction Noise Criteria

Construction noise criteria are based on the guidelines provided in the FTA Guidance Manual. These criteria, summarized in Table 8 below, are based on land use and time of day and are given in terms of Leq for an 8-hour work shift.

Table 8. FTA Construction Noise Criteria

| Land Use | Noise Limit, 8-Hour Leq (dBA) | |
|-------------|-------------------------------|-----------|
| | Daytime | Nighttime |
| Residential | 80 | 70 |
| Commercial | 85 | 85 |
| Industrial | 90 | 90 |

5. FUTURE BUILD CONDITIONS

This section summarizes the models used to predict future noise and vibration levels for potential sources of community impact related to the Capitol Expressway Corridor Project. These sources include LRT train operation, bus and automobile traffic at stations, ancillary equipment and construction activities. The projection models for these sources are described below.

5.1 LRT Noise Projections

The primary component of wayside noise from LRT train operations is wheel/rail noise, which results from the steel wheels rolling on the steel rails. Secondary sources, such as vehicle air-conditioning and other ancillary equipment, will sometimes be audible, but are not expected to be significant factors. The projection of wayside noise from LRT train operations was based on the anticipated Capitol Expressway Corridor LRT operating plan and the prediction model specified in the FTA guidance manual. Significant factors are summarized below:

- Based on measured noise data and on the VTA vehicle dimensions, the predictions assume that a single 90-foot long vehicle operating at 40 mph on ballast and tie track with continuous welded rail (CWR) generates a maximum noise level of 79 dBA at a distance of 50 feet from the track centerline.
- The operating period of the VTA Capitol Expressway Corridor LRT was assumed to be between 4:30 a.m. and 1:30 a.m. The LRT was assumed to operate with headways of ten minutes between 6:00 a.m. and 7:30 p.m., fifteen minutes from 7:30 p.m. to 11:30 p.m., and thirty-minute headways between 11:30 p.m. and 1:30 a.m. and between 4:30 a.m. and 6:00 a.m.
- 2 car train consists are assumed to run during peak hours from 6:00 a.m. to 9:00 a.m. and from 3:30 p.m. to 7:30 p.m.; one car train consists are assumed to run during base hours from 9:00 a.m. to 3:30 p.m. and one car train consists are assumed to run during the evening and early/late periods from 7:30 p.m. to 1:30 a.m. and from 4:30 a.m. to 6:00 a.m.
- Vehicle operating speeds are based on maximum speeds along the Capitol Expressway Corridor, taking into account station locations. The speed limits range from 35 mph to 50 mph along the corridor.
- The projections near grade crossings include noise from train horns. The noise levels are based on typical LRT system audible warning signal equipment and practices.
- Wheel impacts at crossovers and other special trackwork typically cause a noise increase of about 6 dBA near such locations.
- The effects of existing noise walls along the corridor were included in the noise projections.

Because many of the inputs into the noise model, such as the operating periods, headways and detailed speed projections were not fully developed, a number of assumptions were made regarding these inputs.

When more detailed information is available, and if there are significant differences from the assumed parameters discussed above, the noise projections may need to be further refined.

The projected unshielded L_{max} for a one car train, and the L_{dn} and peak-hour $L_{eq}(hr)$ for the above train schedule are shown in Figures 9, 10 and 11, respectively, as a function of distance for several LRT train speeds.

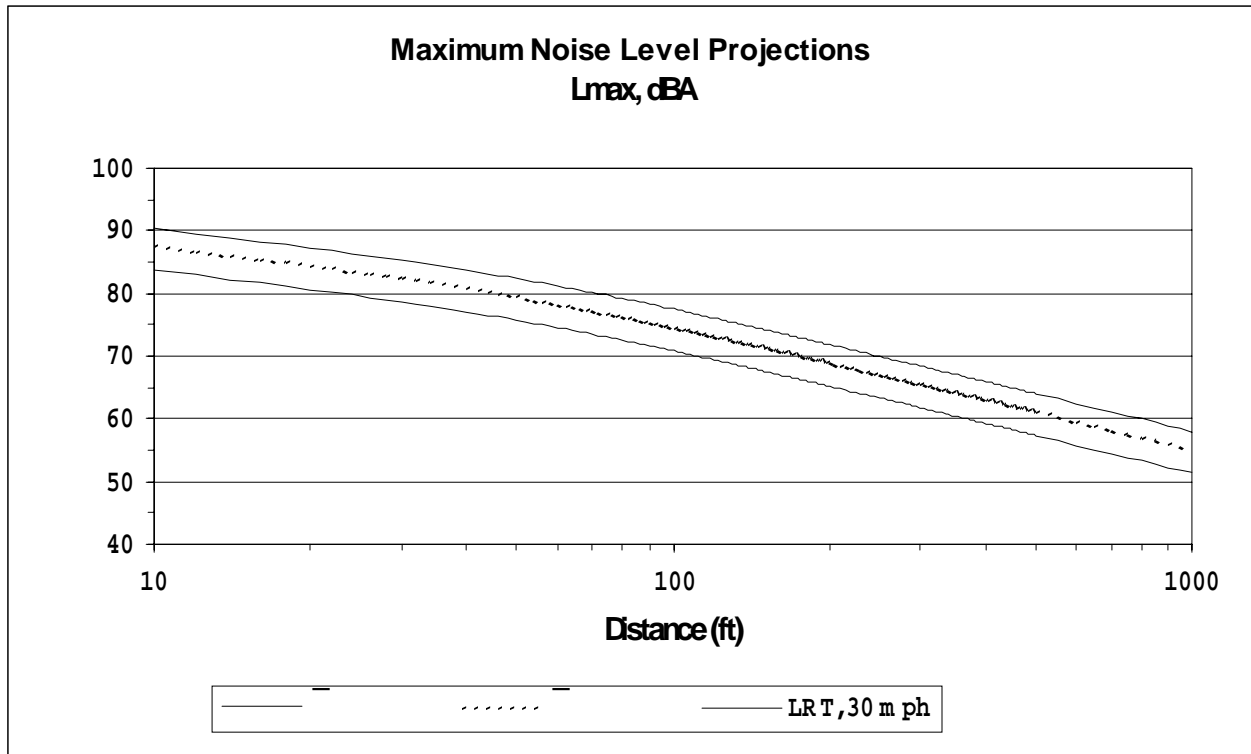

Figure 9. Projected Maximum LRT Noise Levels

Figure 10. Projected 24-Hour Noise Exposure From LRT Operations

Figure 11. Projected Peak-Hour Noise Exposure From LRT Operations

5.2 LRT Vibration Projections

The potential vibration impact from LRT operation was assessed on an absolute basis using the FTA criteria. The following factors were used in determining potential vibration impacts along the Capitol Expressway Corridor:

- Vibration source levels for the VTA vehicles were based on direct measurements conducted by HMMH and Wilson Ihrig and Associates.
- Vibration propagation tests were conducted at four sites along the corridor near sensitive receptors. These tests measured the response of the ground to an input force. The results of these tests were combined with the vibration source levels to provide projections of vibration levels from vehicles operating on the Capitol Expressway Corridor.
- Vehicle operating speeds are based on maximum speeds along the Capitol Expressway Corridor, taking into account station locations. The speed limits range from 35 mph to 50 mph along the corridor.
- Wheel impacts at crossovers and other special trackwork typically cause a vibration increase of about 10 VdB near such locations.

The assumed vehicle vibration characteristics (represented by the force density spectrum in Figure 12) were combined with the ground vibration propagation test results (represented by transfer mobility spectra such as those shown in Figure 8) to project vibration levels as a function of distance for each of the four test sites. The results of these transfer mobility tests and the projected LRT vibration spectra at each site are presented in Appendix C. The results suggested dividing the rail corridor into four regions for the purposes of vibration projections, defined as follows:

- Region A – Start of Alignment to Cunningham Avenue (Represented by Test Site V1)
- Region B – Quimby Road to US101 (Represented by Test Site V2)
- Region C – US101 to Tuers Road (Represented by Test Site V3)
- Region D – Tuers Road to End of Alignment (Represented by Test Site V4)

The resulting projections of maximum ground vibration levels from LRT operations at 55 mph for each of the above four regions are provided in Figure 13. Each of the curves has a different level vs. distance characteristic, which determines the impact distance in each of the regions. The differences in the vibration propagation are typically due to differences in soil type, depth to bedrock and other localized conditions. The results suggest that Region C has the highest projected levels close to the track. Maximum ground vibration level projections at various LRT train speeds are provided separately for Regions A, B, C and D in Figures 14, 15, 16 and 17, respectively.

Figure 12. VTA LRT Vehicle Force Density Spectrum

Figure 13. Projected Maximum Vibration Levels for LRT Operations at 55 mph

Figure 14. Projected Maximum Vibration Levels for LRT Operations in Region A

Figure 15. Projected Maximum Vibration Levels for LRT Operations in Region B

Figure 16. Projected Maximum Vibration Levels for LRT Operations in Region C

Figure 17. Projected Maximum Vibration Levels for LRT Operations in Region D

5.3 Station Noise Projections

In addition to noise impact from LRT train operations, noise impact may occur at sensitive receptors near LRT stations due to station-generated bus noise. However, the only station facility with bus activities is the Eastridge Transit Center, which is not located near any residential areas. Therefore, there is no need to assess the impact of bus noise at this station.

5.4 Ancillary Equipment Noise Projections

The traction power substations are the only ancillary equipment with much potential to cause noise impact. The major noise sources associated with substations are magnetostriction of the transformer core and cooling fans. It is generally possible to eliminate potential for noise impact from substations by including noise limits in the procurement documents.

The evaluation of noise from the substations is based on the method included in the FTA Guidance Manual. The basic relationship, based on measurements of substations on other LRT systems, is:

$$L(d) = 76 - 20 \log(d) \quad \text{where "d" is the distance from the substation building in feet.}$$

5.5 Audible Warning Device Noise Projections

For areas near grade crossings, noise exposure projections for train whistles and crossing bells were combined with the projections for LRT train noise. For the purpose of these projections, the whistles were modeled as moving point sources and the bells were modeled as stationary point sources. Based on experience on similar transit systems, the projections assume that the whistles generate a noise level of 78 dBA at 50 feet from the track for a five-second period as trains approach each crossing. The bells are estimated to generate a noise level of 72 dBA at 50 feet for twenty seconds prior to and ten seconds following each train.

5.6 Construction Noise Projections

Construction noise varies greatly depending on the construction process, type and condition of equipment used, and layout of the construction site. Many of these factors are traditionally left to the contractor's discretion, which makes it difficult to accurately estimate levels of construction noise. Overall, construction noise levels are governed primarily by the noisiest pieces of equipment. For most construction equipment, the engine, which is usually diesel, is the dominant noise source. This is particularly true of engines without sufficient muffling. For special activities such as impact pile driving and pavement breaking, noise generated by the actual process dominates.

Temporary noise during construction of the new tracks and the stations has the potential of being intrusive to residents near the construction sites. Most of the construction would consist of site preparation and laying new track, and would only occur during daytime hours.

It is recommended that consideration be given to: (1) including specific residential property line noise limits in the construction specifications for this project, and (2) performing noise monitoring during construction to verify compliance with the limits. This approach allows the contractor flexibility to meet the noise limits in the most efficient and cost effective manner. Experience suggests that community

annoyance with construction noise will be minimal if: the Resident Engineer is committed to minimizing excessive noise; noise monitoring is performed to verify compliance with the noise limits; and a complaint resolution procedure is in place to rapidly address any problems that may develop.

Construction activities that could cause intrusive vibration include vibratory compaction, jackhammers, and use of tracked vehicles such as bulldozers. The most serious sources of construction vibration are blasting and pile driving. If these activities are planned, alternatives should be investigated to minimize the vibration impact. Avoiding vibration impacts during construction can be achieved through numeric limits in the construction specifications.

Table 9 summarizes some of the available data on noise emissions of construction equipment from the FTA Guidance Manual. Shown are the average of the Lmax values at a distance of 50 feet. Although the noise levels in the table represent typical values, there can be wide fluctuations in the noise emissions of similar equipment. Construction noise at a given noise-sensitive location depends on the magnitude of noise during each construction phase, the duration of the noise, and the distance from the construction activities.

Table 9. Construction Equipment Noise Emission Levels

| Equipment Type | Typical Sound Level at 50 ft (dBA) |
|---------------------------------------------------------|------------------------------------|
| Backhoe | 80 |
| Bulldozer | 85 |
| Compactor | 82 |
| Compressor | 81 |
| Concrete Mixer | 85 |
| Concrete Pump | 82 |
| Crane, Derrick | 88 |

| Loader | 85 |
| Pavement Breaker | 88 |
| Paver | 89 |
| Pile Driver, Impact | 101 |
| Pump | 76 |
| Roller | 74 |
| Truck | 88 |
| Source: Federal Transit Administration Guidance Manual. | |

Projecting construction noise requires a construction scenario of the equipment likely to be used and the average utilization factors or duty cycles (i.e. the percentage of time during operating hours that the equipment operates under full power during each phase). Using the typical sound emission characteristics, as given in Table 9, it is then possible to estimate Leq or Ldn at various distances from the construction site.

The noise impact assessment for a construction site is based on:

- an estimate of the type of equipment that will be used during each phase of the construction and the average daily duty cycle for each category of equipment,
- typical noise emission levels for each category of equipment such as those in Table 9, and
- estimates of noise attenuation as a function of distance from the construction site.

Construction noise estimates are always approximate because of the lack of specific information available at the time of the environmental assessment. Decisions about the procedures and equipment to be used are made by the contractor. Project designers usually try to minimize constraints on how the construction will be performed and what equipment will be used so that contractors can perform construction in the most cost effective manner.

Table 10 is an example of the noise projections for equipment that is often used during tie-and-ballast track construction. For the calculations it is assumed that all the equipment is located at the geometric center of the construction work site. Based on this scenario, a 8-hour Leq of 88 dBA should be expected at a distance of 50 feet from the geometric center of the work site. This calculation in Table 10 does not assume any noise mitigation measures or any limits on the contractor about how much noise can be made. With at-grade track construction, the duration of the activities at a specific location along the alignment will be relatively limited, usually a matter of several weeks. As a result, even when there may be noise impacts, the limited duration of the construction can mean that mitigation is not cost effective.

Table 10. Typical Equipment List, At-Grade Track Construction

| Equipment Item | Typical Maximum Sound Level at 50 ft (dBA) | Equipment Utilization Factor (%) | Leq (dBA) |
|---------------------------------------------------------|---------------------------------------------------|-----------------------------------------|------------------|
| Air Compressor | 83 | 50% | 80 |
| Backhoe | 80 | 40% | 76 |

6. NOISE AND VIBRATION IMPACT ASSESSMENT

A detailed noise and vibration impact assessment was performed based on the criteria discussed in Section 4 and on the projections described in Section 5. The assessment methods and results for the various project sources are described below.

6.1 LRT Noise Assessment

This section presents the analysis of potential noise impacts due to the operation of the Capitol Expressway LRT and discusses mitigation measures to minimize adverse impacts.

6.1.1 Approach

The assessment of noise impact from LRT train operations is based on a comparison of existing and projected future noise exposure for different land use categories. The following steps were performed to assess train noise impact:

- A detailed land-use survey was conducted along the project corridor to identify and classify all noise-sensitive receptors according to the categories defined in Section 4.1. The vast majority of these receptors are single and multi-family residences, falling under FTA Category 2. The remaining receptors were institutional sites falling under FTA Category 3, including three churches, a medical office, two parks and high school athletic fields.
- The receptors were clustered based on distance to the tracks, acoustical shielding between the receptors and the tracks, and location relative to crossovers and grade crossings.
- The existing noise exposure at each cluster of receptors was estimated based on the ambient noise measurements discussed in Section 3.1, and was used to determine the thresholds for impact and severe impact using the FTA criteria presented in Section 4.1.
- Projections of future LRT noise at each cluster of receptors were developed based on distance from the tracks, train schedule and train speed using the methods described in Section 5.1.
- In areas where the projections showed either degree of impact, mitigation options were evaluated and new projections were developed assuming mitigation of all impacts.

6.1.2 Noise Impact Assessment for Residential Land Use

6.1.2.1 No Build Alternative

The No Build Alternative is not expected to result in any noise impacts.

6.1.2.2 Baseline Alternative

The Baseline Alternative is not expected to result in any noise impacts.

6.1.2.3 LRT Alternative

For the LRT alternative, detailed comparisons of the existing and future noise levels are presented in Tables 11 and 12. Table 11 details the noise impacts for the light rail alternative and Table 12 details the impacts for the light rail alternative options. Tables 11 and 12 include results for the Category 2 receptors along the alignment with both daytime and nighttime sensitivity to noise (e.g. residences, hotels and hospitals). In addition to the civil station, distance to the near track and proposed LRT speed, each table includes the existing noise level, the projected noise level from LRT operations and the impact criteria for each receptor or receptor group. Based on a comparison of the predicted project noise level with the impact criteria, the impact category is listed, along with the predicted total noise level and projected noise increase due to the introduction of LRT service. Tables 11 and 12 also include an inventory of the number of impacts and severe impacts at each sensitive receptor location.

1. Noise levels are based on Ldn and are measured in dBA.
2. Predicted levels include a 5dBA penalty applied to audible signal noise, where applicable.
3. Dashes indicate that no noise sensitive receivers were located in this segment of the corridor, or that the LRT tracks are in a tunnel.

The assessment of impact is based on comparing the projected increase in L_{dn} with the impact thresholds listed in Table 3 (Section 4.1). Tables 11 and 12 include columns of the projected increase and the increase necessary for the two degrees of impact, *Impact* and *Severe Impact*. As discussed in Section 4.1, FTA states that in implementing these criteria, Severe Impacts should be mitigated unless there are no practical means to do so.

The results in Table 11 project noise impact at a total of 27 residences for the LRT alternative, all with moderate impact. The following are brief discussions of each impacted Category 2 land use area:

Northern Terminus to Story Rd (East) – There are nine residences at this location projected to have noise impact. The noise impacts are due to the proximity of the tracks (45 feet) to the residences and the presence of the elevated structure.

Northern Terminus to Story Rd (West) – There are three residences at this location projected to have noise impact. The noise impacts are due to the proximity of the tracks (50 feet) to the residences.

Story Rd to Ocala Ave (East) – No noise impact is projected at this location.

Story Rd to Ocala Ave (West) – There are five residences at this location projected to have noise impact. The noise impacts are due to the presence of the elevated structure and the speed of the LRT (45 mph).

Ocala Ave to Cunningham Ave (East) – No noise impact is projected at this location.

Ocala Ave to Cunningham Ave (West) – No noise impact is projected at this location.

Quimby Rd to Aborn Rd (East) – No noise impact is projected at this location.

Quimby Rd to Aborn Rd (West) – No noise impact is projected at this location.

Aborn Rd to Silver Creek Rd (East) – There are ten residences at this location projected to have noise impact. The noise impacts are due to the presence of the elevated structure. Because of the elevated structure, the existing noise barrier at this location is ineffective at shielding the noise from LRT operations.

Aborn Rd to Silver Creek Rd (West) – No noise impact is projected at this location.

Silver Creek Rd to US101 (East) – No noise impact is projected at this location.

Silver Creek Rd to US101 (West) – No noise impact is projected at this location.

US101 to Tuers Rd (East) – No noise impact is projected at this location.

US101 to Tuers Rd (West) – No noise impact is projected at this location.

Tuers Rd to Senter Rd (East) – No noise impact is projected at this location.

Tuers Rd to Senter Rd (West) – No noise impact is projected at this location.

Senter Rd to US82 (East) – No noise impact is projected at this location.

Senter Rd to US82 (West) – No noise impact is projected at this location.

US82 to Snell Ave (East) – No noise impact is projected at this location.

US82 to Snell Ave (West) – No noise impact is projected at this location.

Snell Ave to Vista Park Dr (East) – No noise impact is projected at this location.

Snell Ave to Vista Park Dr (West) – No noise impact is projected at this location.

Vista Park Dr to Narvez Ave (East) – No noise impact is projected at this location.

Vista Park Dr to Narvez Ave (West) – No noise impact is projected at this location.

Narvez Ave to Southern Terminus (East) – No noise impact is projected at this location.

Narvez Ave to Southern Terminus (West) – No noise impact is projected at this location.

The following are brief discussions for the light rail alternative options:

Alum Rock Avenue to Story Road

Capitol Avenue/Capitol Expressway Tunnel/Story Road Aerial Option (East) – No noise impact is projected at this location.

Capitol Avenue/Capitol Expressway Tunnel/Story Road Aerial Option (West) – No noise impact is projected at this location.

Story Road to Eastridge Transit Center

Story Road to Ocala Avenue (Tunnel/Aerial Option) (East) – No noise impact is projected at this location.

Story Road to Ocala Avenue (Tunnel/Aerial Option) (West) – There are five residences at this location projected to have noise impact. The noise impacts are due to the presence of the elevated structure. Because of the elevated structure, the existing noise barrier at this location is ineffective at shielding the noise from LRT operations.

North of Eastridge Transit Center Tunnel with At-Grade Stn Option (East) – No noise impact is projected at this location.

North of Eastridge Transit Center Tunnel with At-Grade Stn Option (West) – No noise impact is projected at this location.

North of Eastridge Transit Center Tunnel (includes Between Ocala and Cunningham Ave Stn Option) (East) – No noise impact is projected at this location.

North of Eastridge Transit Center Tunnel (includes Between Ocala and Cunningham Ave Stn Option) (West) – No noise impact is projected at this location.

North of Eastridge Transit Center Tunnel (includes Cunningham Avenue Station Option) (East) – No noise impact is projected at this location.

North of Eastridge Transit Center Tunnel (includes Cunningham Avenue Station Option) (West) – No noise impact is projected at this location.

Eastridge Transit Center to Aborn Road

South of Eastridge Transit Center Aerial Crossing Option (only with Eastridge Aerial Station Option) (East) – No noise impact is projected at this location.

South of Eastridge Transit Center Aerial Crossing Option (only with Eastridge Aerial Station Option) (West) – No noise impact is projected at this location.

South of Eastridge Transit Center Side Running/Tunnel at Nieman Blvd Option (East) – There are four residences at this location projected to have noise impact. The impacts are due to the speed of the LRT (50 mph) and the proximity of the tracks (75 feet).

South of Eastridge Transit Center Side Running/Tunnel at Nieman Blvd Option (West) – No noise impact is projected at this location.

South of Eastridge Transit Center Side-Running Trench Option (East) – No noise impact is projected at this location.

South of Eastridge Transit Center Side-Running Trench Option (West) – No noise impact is projected at this location.

South of Eastridge Transit Center Side-Running At-Grade/Aerial Option (East) – No noise impact is projected at this location.

South of Eastridge Transit Center Side-Running At-Grade/Aerial Option (West) – No noise impact is projected at this location.

Quimby Road to Silver Creek Road (East) – There are four residences at this location projected to have noise impact. The noise impacts are due to the presence of the elevated structure. Because of the elevated structure, the existing noise barrier at this location is ineffective at shielding the noise from LRT operations.

Quimby Road to Silver Creek Road (West) – No noise impact is projected at this location.

Quimby Road to Aborn Road (East) – There are twenty residences at this location projected to have noise impact. The noise impacts are due to the presence of the elevated structure. Because of the elevated structure, the existing noise barrier at this location is ineffective at shielding the noise from LRT operations.

Quimby Road to Aborn Road (West) – There are 98 residences at this location projected to have noise impact and four to have severe noise impact. The noise impacts are due to the presence of the elevated structure. Because of the elevated structure, the existing noise barrier at this location is ineffective at shielding the noise from LRT operations.

Aborn Road to Silver Creek Road

Aerial Crossing at Aborn Road Option (East) – There are ten residences at this location projected to have noise impact. The noise impacts are due to the presence of the elevated structure. Because of the elevated structure, the existing noise barrier at this location is ineffective at shielding the noise from LRT operations.

Aerial Crossing at Aborn Road Option (West) – No noise impact is projected at this location.

Silver Creek Road to Coyote Creek

Aerial Crossing of Hwy 101 Option (includes McLaughlin Aerial Stn) - Silver Creek Rd to U.S. 101 (East) – No noise impact is projected at this location.

Aerial Crossing of Hwy 101 Option (includes McLaughlin Aerial Stn) - Silver Creek Rd to U.S. 101 (West) – No noise impact is projected at this location.

U.S. 101 to Tuers Road (East) – There are four residences at this location projected to have noise impact. The noise impacts are due to the presence of the elevated structure. Because of the elevated structure, the existing noise barrier at this location is ineffective at shielding the noise from LRT operations.

U.S. 101 to Tuers Road (West) – There are three residences at this location projected to have noise impact. The noise impacts are due to the presence of the elevated structure. Because of the elevated structure, the existing noise barrier at this location is ineffective at shielding the noise from LRT operations.

Coyote Creek to Highway 87

At-grade, median-running between Coyote Creek and State Route 87 (With under Hwy 87 Station Option (East) – There are two duplexes at this location (for a total of four residences) projected to have noise impact. The noise impacts are due to the presence of the crossover at Station 423.

At-grade, median-running between Coyote Creek and State Route 87 (With under Hwy 87 Station Option (West) – No noise impact is projected at this location.

6.1.3 Noise Impact Assessment for Institutional Land Use

Institutional land use near the corridor includes three churches, two parks, a medical office and a set of high school athletic fields. Table 13 summarizes the noise impact projections at these locations. The distances indicated in the table refer to either the location of the closest building, or the closest point of activity for sites with outdoor land use.

The analysis for the institutional receptors was identical to that for the residential receptors, except that the impact thresholds for noise increase are based on the energy-average Leq measured at representative nearby sites during the proposed hours or peak transit service.

Table 13 includes columns of the projected maximum LRT noise level and increase necessary for the two degrees of impact based on the FTA criteria (Impact and Severe Impact). The impact thresholds for noise increase are based on the energy-average Leq measured at representative nearby sites during the proposed hours of peak transit service.

Table 13. Noise Impacts for Category 3 Land Use

| Location | Civil Stn | Side of Track | Dist to Near Track (ft) | Speed (mph) | Exist. Noise Level ¹ | Project Noise Level ¹ | | | Impact Category | Total Noise Level ₁ | Noise Level Incr. ¹ |

| 1. Noise levels are based on Leq and are measured in dBA. | | | | | | | | | | | |
| 2. Predicted levels include a 5dBA penalty applied to audible signal noise, where applicable. | | | | | | | | | | | |

No impacts are projected at any Category 3 (institutional) receptors for either the LRT Alternative or any of the options.

6.2 LRT Vibration Assessment

6.2.1 Approach

The approach used for assessing vibration impact generally follows the approach used for the noise impact, except that existing vibration is not considered when evaluating impact. The impact threshold for LRT operations is 72 VdB for residential buildings (Category 2) and 75 VdB for institutional buildings (Category 3).

6.2.1.1 No Build Alternative

The No Build Alternative is not expected to result in any vibration impacts.

6.2.1.2 Baseline Alternative

The Baseline Alternative is not expected to result in any vibration impacts.

6.2.1.3 LRT Alternative

For the LRT alternative, the estimated root mean square (RMS) velocity levels (VdB re 1 micro-in./sec.) for sensitive receptors at representative distances are provided in Tables 14 and 15. Table 14 details the vibration impacts for the light rail alternative and Table 15 details the impacts for the light rail alternative options. These tables summarize the results of the analysis in terms of anticipated exceedances of the FTA criteria for “frequent events” (defined as more than 70 events per day). The criteria are discussed in more detail above.

Vibration-sensitive locations along the alignment are listed in Tables 14 and 15 for Category 2 land use. The tables list the locations, the civil station, the distance to the near track, and the projected LRT speed at each location. In addition, the predicted project vibration level and the impact criterion level are indicated along with the number of impacts projected for each receptor or receptor group.

Table 14. Light Rail Alternative Land Use Category 2 Vibration Impacts

1. Vibration levels are measured in VdB referenced to 1 µin/sec.
2. Ground-borne noise levels are measured in dBA.
3. Dashes indicate that no vibration sensitive receivers were located in this segment of the corridor.
4. Ground-borne noise is only assessed for subway sections of the alignment.
5. The vibration levels, ground-borne noise levels and numbers of impacts in parenthesis assume that shredded tires are a project feature where the vibration levels are above the impact criterion.

The results in Table 14 project ground-borne vibration impact at a total of 187 residences for the LRT alternative and 51 vibration impacts assuming the use of shredded tires as a project feature where the vibration levels are above the impact criterion. The following are brief discussions of each impacted Category 2 land use area for the light rail alternative:

Northern Terminus to Story Rd (East) – There is one residence (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impact is due to the proximity of the tracks (55 feet) to the residences.

Northern Terminus to Story Rd (West) – There is one residence (one with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impact is due to the proximity of the tracks (40 feet) to the residences. This residence identified as a right-of-way acquisition in the conceptual engineering plans.

Story Rd to Ocala Ave (East) – No vibration impact is projected at this location.

Story Rd to Ocala Ave (West) – There are twelve residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (75 feet) to the residences and the speed of the LRT vehicles (45 mph).

Ocala Ave to Cunningham Ave (East) – No vibration impact is projected at this location.

Ocala Ave to Cunningham Ave (West) – No vibration impact is projected at this location.

Quimby Rd to Aborn Rd (East) – There are 73 residences (33 with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (65 feet) to the residences and the speed of the LRT vehicles (55 mph).

Quimby Rd to Aborn Rd (West) – There are eight residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (110 feet) to the residences and the speed of the LRT vehicles (35 mph).

Aborn Rd to Silver Creek Rd (East) – There are four residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (90 feet) to the residences and the speed of the LRT vehicles (45 mph).

Aborn Rd to Silver Creek Rd (West) – No vibration impact is projected at this location.

Silver Creek Rd to US101 (East) – There are nine residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (70 feet) to the residences.

Silver Creek Rd to US101 (West) – No vibration impact is projected at this location.

US101 to Tuers Rd (East) – There are three residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (105 feet) to the residences and the speed of the LRT vehicles (55 mph).

US101 to Tuers Rd (West) – There are eight residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (75 feet) to the residences.

Tuers Rd to Senter Rd (East) – There are four residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (70 feet) to the residences and the speed of the LRT vehicles (50 mph).

Tuers Rd to Senter Rd (West) – No vibration impact is projected at this location.

Senter Rd to US82 (East) – There are twelve residences (twelve with the inclusion of shredded tires as a project feature) in three multi-family buildings at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (75 feet) to the residences and the speed of the LRT vehicles (51 mph).

Senter Rd to US82 (West) – There are 32 residences (six with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (60 feet) to the residences and the speed of the LRT vehicles (55 mph).

US82 to Snell Ave (East) – No vibration impact is projected at this location.

US82 to Snell Ave (West) – No vibration impact is projected at this location.

Snell Ave to Vista Park Dr (East) – No vibration impact is projected at this location.

Snell Ave to Vista Park Dr (West) – No vibration impact is projected at this location.

Vista Park Dr to Narvez Ave (East) – No vibration impact is projected at this location.

Vista Park Dr to Narvez Ave (West) – There are 21 residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (100 feet) to the residences and the speed of the LRT vehicles (49 mph).

Narvez Ave to Southern Terminus (East) – No vibration impact is projected at this location.

Narvez Ave to Southern Terminus (West) – No vibration impact is projected at this location.

The following are brief discussions of each impacted Category 2 land use area for the light rail alternative options:

Alum Rock Avenue to Story Road

Capitol Avenue/Capitol Expressway Tunnel/Story Road Aerial Option (East) – There are four residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. In addition, there are eleven ground-borne noise impacts (none with the inclusion of shredded tires as a project feature) at this location. The impacts are due to the proximity of the tracks (55 feet) to the residences.

Capitol Avenue/Capitol Expressway Tunnel/Story Road Aerial Option (West) – There are four residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. In addition, there are three ground-borne noise impacts (none with the inclusion of shredded tires as a project feature) at this location. The impacts are due to the proximity of the tracks (60 feet) to the residences.

Story Road to Eastridge Transit Center

North of Eastridge Transit Center Tunnel with At-Grade Stn Option (East) – No vibration impact is projected at this location.

North of Eastridge Transit Center Tunnel with At-Grade Stn Option (West) – There are five residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (70 feet) to the residences and the speed of the LRT vehicles (45 mph).

North of Eastridge Transit Center Tunnel (includes Between Ocala and Cunningham Ave Stn Option) (East) – No vibration impact is projected at this location.

North of Eastridge Transit Center Tunnel (includes Between Ocala and Cunningham Ave Stn Option) (West) – There are six residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (70 feet) to the residences and the speed of the LRT vehicles (48 mph).

North of Eastridge Transit Center Tunnel (includes Cunningham Avenue Station Option) (East) – There are two residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (70 feet) to the residences.

North of Eastridge Transit Center Tunnel (includes Cunningham Avenue Station Option) (West) – There are two residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (70 feet) to the residences and the speed of the LRT vehicles (52 mph).

Eastridge Transit Center to Aborn Road

South of Eastridge Transit Center Aerial Crossing Option (only with Eastridge Aerial Station Option) (East) – There are eight residences (eight with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (90 feet) to the residences and the speed of the LRT vehicles (55 mph).

South of Eastridge Transit Center Aerial Crossing Option (only with Eastridge Aerial Station Option) (West) – No vibration impact is projected at this location.

South of Eastridge Transit Center Side Running/Tunnel at Nieman Blvd Option (East) – There are 83 residences (four with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. In addition, there are 21 ground-borne noise impacts (none with the inclusion of shredded tires as a project feature) at this location. The impacts are due to the proximity of the tracks (75 feet) to the residences and the speed of the LRT vehicles (50 mph).

South of Eastridge Transit Center Side Running/Tunnel at Nieman Blvd Option (West) – There are 24 residences (twenty with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. In addition, there are 45 ground-borne noise impacts (25 with the inclusion of shredded tires as a project feature) at this location. The impacts are due to the speed of the LRT vehicles (55 mph).

South of Eastridge Transit Center Side-Running Trench Option (East) – There are ten residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (90 feet) to the residences and the speed of the LRT vehicles (55 mph).

South of Eastridge Transit Center Side-Running At-Grade/Aerial Option (East) – There are 24 residences (22 with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. In addition, there are 24 ground-borne noise impacts (24 with the inclusion of shredded tires as a project feature) at this location. The impacts are due to the proximity of the tracks (75 feet) to the residences and the speed of the LRT vehicles (53 mph).

South of Eastridge Transit Center Side-Running At-Grade/Aerial Option (West) – There are 95 residences (four with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. In addition, there are 96 ground-borne noise impacts (36 with the inclusion of shredded tires as a project feature) at this location. The impacts are due to the proximity of the tracks (75 feet) to the residences and the speed of the LRT vehicles (50 mph).

Quimby Road to Aborn Road (East) – No vibration impact is projected at this location.

Quimby Road to Aborn Road (West) – No vibration impact is projected at this location.

Quimby Road to Aborn Road (East) – No vibration impact is projected at this location.

Quimby Road to Aborn Road (West) – There are four residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (40 feet) to the residences and the speed of the LRT vehicles (53 mph).

Aborn Road to Silver Creek Road

Aerial Crossing at Aborn Road Option (East) – No vibration impact is projected at this location.

Aerial Crossing at Aborn Road Option (West) – No vibration impact is projected at this location.

Silver Creek Road to Coyote Creek

Aerial Crossing of Hwy 101 Option (includes McLaughlin Aerial Stn) - Silver Creek Rd to U.S. 101 (East) – No vibration impact is projected at this location.

Aerial Crossing of Hwy 101 Option (includes McLaughlin Aerial Stn) - Silver Creek Rd to U.S. 101 (West) – No vibration impact is projected at this location.

U.S. 101 to Tuers Road (East) – No vibration impact is projected at this location.

U.S. 101 to Tuers Road (West) – No vibration impact is projected at this location.

Coyote Creek to Highway 87

At-grade, median running between Coyote Creek and State Route 87 (East) – There are four residences (four with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the presence of the crossover at station 423.

At-grade, median running between Coyote Creek and State Route 87 (West) – There are eighteen residences (none with the inclusion of shredded tires as a project feature) at this location projected to have vibration impact. The vibration impacts are due to the proximity of the tracks (100 feet) to the residences and the speed of the LRT vehicles (49 mph).

Institutional land use near the corridor includes three churches, two parks, a medical office and a set of high school athletic fields. Table 16 summarizes the vibration impact projections at these locations. Vibration impact is only assessed for indoor usage; parks are not included in the vibration assessment. The analysis for the institutional receptors was identical to that for the residential receptors, except that the impact thresholds for vibration are higher than those for residential receptors.

Table 16. Land Use Category 3 Vibration Impacts

| <p>1. Vibration levels are measured in VdB referenced to 1 µin/sec.</p> <p>2. Ground-borne noise levels are measured in dBA.</p> <p>3. Ground-borne noise is only assessed for subway sections of the alignment.</p> <p>4. The ground-borne noise level in parenthesis assumes that shredded tires are a project feature where the vibration levels are above the impact criterion.</p> | | | | | | | | | | |

The only institutional impact is for a medical office on the North of Eastridge Transit Center Tunnel option. Ground-borne noise impact is projected at this location (no impact is projected with the inclusion of shredded tires as a project feature). There are no other vibration impacts at institutional receptors.

6.3 Station Noise Assessment

The primary sources of noise at stations are buses entering and exiting the station, bus idling, and traffic associated with park-and-ride lots. Since the stations with these types of activities are not located near any sensitive receptors, there are no noise impacts projected at any of the stations along the Capitol Expressway Corridor.

6.4 Ancillary Equipment Noise Assessment

As described in Section 4.3, the noise criteria for ancillary equipment are based on common guidelines for these types of facilities. There are five substations located within 250 feet of residences. Based on the noise monitoring data, the minimum nighttime ambient L90s range from 38 dBA to 50 dBA, which implies that criterion of 45 dBA would apply at all locations. Using the prediction equation in Section 5.4 for electrical substations, no noise impact is projected for any of the substation locations. However, the substations located at Stations 400 and 438 are located within 40 and 60 feet, respectively, of residences. The projected noise levels at the closest residences for the substations at these two locations are close to the noise criterion and consideration should be given to moving them to locations further from noise sensitive receptors.

6.5 Construction Noise Assessment

Based on the criteria in Section 4.4 and the noise projection in Table 10, and assuming that construction noise is reduced by 6 decibels for each doubling of distance from the center of the site, screening distances for potential construction noise impact can be estimated. These estimates suggest that the potential for construction noise impact will be minimal for commercial and industrial land use, with impact screening distances of 70 feet and 40 feet, respectively. Even for residential land use, the potential for temporary construction noise impact would be limited to locations within about 125 feet of the corridor. However, the potential for noise impact from nighttime construction could extend to residences as far as 400 feet. Potential construction noise impacts will be reevaluated during final design.

7. MITIGATION OF NOISE AND VIBRATION IMPACTS

7.1 LRT Noise Mitigation Measures

Potential mitigation measures for reducing noise impacts from LRT operation are described below.

- **Noise Barriers** - This is a common approach to reducing noise impacts from surface transportation sources. The primary requirements for an effective noise barrier are that (1) the barrier must be high enough and long enough to break the line-of-sight between the sound source and the receiver, (2) the barrier must be of an impervious material with a minimum surface density of 4 lb/sq. ft. and (3) the barrier must not have any gaps or holes between the panels or at the bottom. Because numerous materials meet these requirements, the selection of materials for noise barriers is usually dictated by aesthetics, durability, and cost and maintenance considerations. Depending on the proximity of the barrier to the tracks and on the track elevation, transit system noise barriers typically range in height from between four and eight feet and typically reduce noise levels by 8 – 10 dBA.
- **Building Sound Insulation** - Sound insulation of residences and institutional buildings to improve the outdoor-to-indoor noise reduction has been widely applied around airports and has seen limited application for transit projects. Although this approach has no effect on noise in exterior areas, it may be the best choice for sites where noise barriers are not feasible or desirable, and for buildings where indoor sensitivity is of most concern. Substantial improvements in building sound insulation (on the order of 5 to 10 dBA) can often be achieved by adding an extra layer of glazing to the windows, by sealing any holes in exterior surfaces that act as sound leaks, and by providing forced ventilation and air-conditioning so that windows do not need to be opened. Building sound insulation can provide 10 – 20 dBA of noise reduction, depending on the existing condition of the structure and the extent of treatments.
- **Special Trackwork at Crossovers** - Because the impacts of LRT wheels over rail gaps at track crossover locations increases LRT noise by about 6 dBA, crossovers are a major source of noise impact when they are located in sensitive areas. If crossovers cannot be relocated away from sensitive areas, another approach is to use spring rail or moveable point frogs in place of standard rigid frogs at turnouts. These devices allow the flangeway gap to remain closed in the main traffic direction for revenue service trains and typically reduce noise levels by 6 dBA.
- **LRT Speed Reductions in Sensitive Areas** - Speed reductions will always lower community noise levels, but they are not often implemented for noise control because of the negative impact on the LRT travel time. Thus, their impact on the travel time would need to be evaluated with respect to their potential noise mitigation benefits.

As discussed above, FTA states that in implementing noise impact criteria, severe impacts should be mitigated unless there are no practical means to do so. VTA's policy is to mitigate severe noise impacts; therefore the mitigation recommendations only include those locations with severe impact.

Based on the results of the noise assessment, potential mitigation measures have been identified. The primary mitigation measure would be the construction of sound barrier walls to shield areas where impact is projected. Table 17 indicates the approximate noise barrier locations, lengths, and side of track as well

as the number of severe impacts that would be mitigated. Table 17 provides locations of noise barriers to mitigate only severe impacts.

All severe noise impacts are primarily due to the presence of elevated structures, which reduce the effectiveness of existing noise barriers at shielding residences from noise from LRT operations. Because the noise impacts are due to the elevated structures, the most effective location for noise barriers would be on the elevated structures. If noise barriers can be located on the structures, they would only need to be approximately 4 to 5 feet high to provide effective shielding for sensitive receptors. Detailed design of noise barriers (including height, length and location) will be completed during the engineering phase of the project.

Table 17. Potential Noise Barrier Mitigation Treatment

| Segment | Side of Track | Civil Station | Length (Feet) | Impacts |
|-----------------------|---------------|------------------|---------------|---------|
| Alternative D3 | | | | |
| Quimby Rd to Aborn Rd | West | 175+50 to 180+50 | 500 | 4 |

7.2 LRT Vibration Mitigation Measures

The assessment assumes that the LRT vehicle wheels and track are maintained in good condition with regular wheel truing and rail grinding. Beyond this, there are several approaches to reduce ground-borne vibration from LRT operation, as described below.

- **LRT Speed Reductions in Sensitive Areas** - Speed reductions will always lower ground-borne vibration levels, but they are not always a feasible vibration control measure because of the negative impact on the LRT travel times. Thus, their impact on the travel times will need to be evaluated with respect to their potential vibration mitigation benefits.
- **Ballast Mats** - A ballast mat consists of a pad made of rubber or rubber-like material placed on an asphalt or concrete base with the normal ballast, ties and rail on top. The reduction in ground-borne vibration provided by a ballast mat is strongly dependent on the frequency content of the vibration and design and support of the mat, and can typically range from 3 – 5 VdB.
- **Tire Shred or Recycled Rubber Chip Underlay** - A 12-inch-thick resilient layer of recycled rubber chips placed beneath the sub-ballast layer of standard open ballast and tie track could be incorporated into the track design. This mitigation method would provide results similar to ballast mats, providing a 3–5 VdB reduction.
- **Floating Slabs** - Floating slabs consist of thick concrete slabs supported by resilient pads on a concrete foundation; the tracks are mounted on top of the floating slab. Most successful floating slab installations are in subways, and their use for at-grade track is less common. Although floating slabs are designed to provide vibration reduction at lower frequencies than ballast mats, they are extremely expensive. Floating slabs can typically provide 5 – 13 VdB of reduction, depending on the thickness.

- **Special Trackwork at Crossovers** - Because the impacts of LRT wheels over rail gaps at track crossover locations increases LRT vibration by about 10 VdB, crossovers are a major source of vibration impact when they are located in sensitive areas. If crossovers cannot be relocated away from sensitive areas, another approach is to use spring rail or moveable point frogs in place of standard rigid frogs at turnouts. These devices allow the flangeway gap to remain closed in the main traffic direction for revenue service trains and typically reduce vibration by 10 VdB.
- **Property Acquisitions or Easements** – Additional options for avoiding vibration impacts (and noise impacts also) are for the transit agency to purchase residences likely to be impacted by train operations or to acquire easements for such residences by paying the homeowners to accept the future train vibration conditions. These approaches are usually taken only in isolated cases where other mitigation options are infeasible, impractical, or too costly.

Vibration impacts that exceed FTA severe impact criteria are considered to be significant and to warrant mitigation, if reasonable and feasible. Tables 18 and 19 indicate the civil stations along the corridor where mitigation is recommended to reduce the vibration levels. Table 18 identifies mitigation locations for the light rail alternative and Table 19 identifies mitigation locations for the light rail alternative options. The mitigation locations take into account the removal of vibration impacts at residences identified as right of way acquisitions in the conceptual engineering documents.

At a minimum, mitigation would require the installation of ballast mats. However, other measures (e.g. undertie pads or shredded tires) or a combination of measures may be required to mitigate impacts at some locations. In addition, the vibration impacts on the at-grade, median running between Coyote Creek and State Route 87 option are due to the presence of the crossover at Station 423. The crossover should be moved to the south of Narvez Avenue to mitigate the impacts.

Because of the relatively high number of ground-borne vibration and ground-borne noise impacts along the Capitol Expressway corridor, additional vibration testing may be warranted. The vehicle source vibration levels are higher than expected, and higher than other LRT vehicles in service around the country. Much of the impact along the corridor is due to the high source levels from the vehicles. Additional testing should be performed at an additional location on the existing system to determine if the source level measurements are accurate, or if there is an environmental factor at the test site that is influencing the source vibration levels. Additional vibration propagation tests should also be performed along the corridor to help refine the vibration projections. With additional testing of the vehicles, and more vibration propagation tests, it is possible that the number and magnitude of the vibration impacts could be reduced, resulting in the need for less vibration mitigation.

VTA will use vibration-dampening track construction materials at the impacted locations identified in Tables 18 and 19. The areas identified in Tables 18 and 19 will have shredded tires as a project design feature to mitigate vibration. Areas that may require additional or alternative types of vibration mitigation are noted in the table. The use of ballast mats, special trackwork at crossovers, tire shred or recycled rubber chip underlay, floating slabs, or other measures will be incorporated into the final design to reduce vibration impacts to below the FTA criteria.

Table 18. Light Rail Alternative Recommended Locations for Vibration Mitigation

| Segment | Civil Station | Length (Feet) | Residual Impacts ¹ | |
|-----------------------------------------|------------------|---------------|-------------------------------|--------------------|
| | | | Vibration | Ground-Borne Noise |
| Northern Terminus to Story Road | 8+50 to 14+50 | 600 | 0 | -- |

| Coyote Creek to Highway 87 | | | | |
| At-grade, median-running between Coyote Creek and State Route 87 (With under Highway 87 Station Option) | 413+00 to 416+50 | 350 | 0 | -- |

1. Impacts remaining with the inclusion of shredded tires as a project design feature.
2. Total includes one institutional receptor (medical office).

7.3 Station Noise Mitigation Measures

No station noise impacts are projected and therefore no mitigation measures are required at any of the LRT station sites.

7.4 Ancillary Equipment Noise Mitigation Measures

The substations located at Stations 400 and 438 are located within 40 and 60 feet, respectively, of residences. The projected noise levels at the closest residences for the substations at these two locations are close to the noise criterion and consideration should be given to moving them to locations further from noise sensitive receptors. No other ancillary facility noise impacts are projected and therefore no mitigation measures are necessary.

7.5 Construction Noise Mitigation Measures

Specific residential property line noise limits will be developed during final design and included in the construction specifications for the project. This approach allows the contractor flexibility to meet the noise criteria in the most efficient and cost-effective manner. Noise control measures will be applied as needed to meet the noise criteria and may include the following:

- Avoiding nighttime construction in residential neighborhoods.
- Using specially quieted equipment with enclosed engines and/or high-performance mufflers.
- Locating stationary construction equipment as far as possible from noise-sensitive sites.
- Constructing noise barriers, such as temporary walls or piles of excavated material, between noisy activities and noise-sensitive receivers.
- Re-routing construction-related truck traffic along roadways would cause the least disturbance to residents.
- Avoiding impact pile driving near noise-sensitive areas, where possible. Drilled piles or the use of a sonic or vibratory pile driver are quieter alternatives where the geological conditions permit their use. If impact pile drivers must be used, their use would be limited to the periods between 8:00 a.m. and 5:00 p.m. on weekdays.

With the incorporation of the appropriate noise mitigation measures, impacts from construction-generated noise should not be significant. To provide added assurance, a complaint resolution procedure should also be put in place to rapidly address any noise problems that may develop during construction

Appendix J

Consultation and Coordination

resources, air quality, noise, water quality, geology, visual); changes in the social environment (land use, business and neighborhood disruptions); changes in traffic and pedestrian circulation; changes in transit service and patronage; associated changes in traffic congestion; and impacts on parklands and historic resources. Impacts will be identified both for the construction period and for the long-term operation of the alternatives. The proposed evaluation criteria include transportation, environmental, social, economic, and financial measures, as required by current federal (NEPA) and state (CEQA) environmental laws and current Council on Environmental Quality and FTA guidelines.

To ensure that the full range of issues related to this proposed action are addressed and all significant issues identified, comments and suggestions are invited from all interested parties. Comments or questions concerning this proposed action and the EIS/EIR should be directed to VTA as noted above.

V. FTA Procedures

The EIS/EIR for the Santa Clara/Alum Rock LRT Project will be prepared simultaneously with conceptual engineering for station and alignment options. The EIS/EIR/conceptual engineering process will address the potential use of federal funds for the proposed project, as well as assess the social, economic, and environmental impacts of station and alignment alternatives. Station designs and alignment alternatives will be refined to minimize and mitigate any adverse impacts identified. After publication, the Draft EIS/EIR will be available for public and agency review and comment, and a public hearing will be held. Based on the Draft EIS/EIR and comments received, VTA will select a preferred alternative, which will be described in full detail in the Final EIS/EIR.

Issued on: September 14, 2001.

F. James Kenna,

Deputy Regional Administrator.

DEPARTMENT OF TRANSPORTATION

Federal Transit Administration

Environmental Impact Statement on the Capitol Expressway Light Rail Transit Project in San Jose, CA

AGENCY: Federal Transit Administration, DOT.

ACTION: Notice of intent to prepare an Environmental Impact Statement (EIS)

SUMMARY: The Federal Transit Administration (FTA) and the Santa Clara Valley Transportation Authority (VTA) intend to prepare an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA) and an Environmental Impact Report (EIR) in accordance with the California Environmental Quality Act (CEQA) for a proposed Light Rail Transit (LRT) line in the Capitol Expressway corridor. The proposed line and technology were selected following completion of the Downtown East Valley Major Investment Study (MIS) in August 2000. The MIS considered alternative modes of travel, alignment, and station locations in a 30-square mile study area. The MIS process resulted in a Preferred Investment Strategy that includes LRT improvements in the Capitol Expressway Corridor to improve direct transit service in an approximately 8-mile-long corridor in southeast San Jose, California. The Capitol Expressway Project will be further evaluated during the conceptual engineering phase of the project and carried forward in the EIS/EIR. The EIS/EIR will evaluate a No-Action alternative, LRT alignment and station options, and additional alternatives that emerge from the scoping process. Scoping will be accomplished through correspondence and discussions with interested persons; organizations; federal, state and local agencies; and through a public meeting.

DATES: *Comment Due Date:* Written comments on the scope of alternatives and impacts to be considered in the EIS/EIR must be received no later than November 2, 2001, and must be sent to VTA at the address indicated below.

Scoping Meeting: A public scoping meeting will be held on September 26, 2001, from 6:00 p.m. to 8:00 p.m. at St. Francis of Assisi Catholic Church, 5111 San Felipe Road, San Jose, CA 95135. Phone: (408) 223-1562. The project purpose and alternatives will be presented at this meeting. The building used for the scoping meeting is accessible to persons with disabilities. Any individual who requires special assistance, such as a sign language interpreter, to participate in the scoping meeting should contact Jennifer Rielly, Public Communications Specialist, VTA Community Outreach, at (408) 321-7575 or TDD only at (408) 321-2330. Scoping material will be available at the meeting and may be obtained in advance of the meeting by contacting Mr. Fitzwater at the address or phone number given below.

ADDRESSES: Written comments should be sent to Mr. Thomas Fitzwater, Environmental Planning Manager, VTA, 3331 North First Street, San Jose, CA 95134-1906. Phone: (408) 321-5789. Fax: (408) 321-5787. E-mail: scoping.capitolexpressway@vta.org.

FOR FURTHER INFORMATION CONTACT: Mr. Thomas Fitzwater, Environmental Planning Manager, VTA, 3331 North First Street, San Jose, CA 95134-1906. Phone (408) 321-5789 or Mr. Jerome Wiggins, Office of Planning and Program Development, FTA, 201 Mission Street, Room 2210, San Francisco, CA 94105. Phone: (415) 744-3115. People with special needs should contact Jennifer Rielly, Public Communications Specialist, VTA Community Outreach, at (408) 321-7575 or TDD only at (408) 321-2330.

SUPPLEMENTARY INFORMATION:

I. Scoping

The FTA and VTA invite all interested individuals and organizations, and federal, state, regional, and local agencies to provide comments on the scope of the project. A summary of the MIS, Downtown East Valley Major Investment Study—Project Summary Report (December 2000), is available for public review at the following public libraries: (1) Dr. Martin Luther King, Jr. Main Library, 180 West San Carlos Street, San Jose, CA 95113; (2) Hillview Branch Library, 2255 Ocala Avenue, San Jose, CA 95122; (3) Evergreen Branch Library, 2635 Aborn Road, San Jose, CA 95121; and (4) Seventrees Branch Library, 3597 Cas Drive, San Jose, CA 95111. The MIS summary is also available by contacting Mr. Fitzwater at the address and phone number given above. Mr. Fitzwater should also be contacted to be placed on the project mailing list and to receive additional information about the project. Written comments on the alternatives and potential impacts to be considered should be sent to Mr. Fitzwater.

II. Project Purpose and Need

The project purpose is to improve public transit service in the downtown and East Valley areas of the City of San Jose by addressing the following specific goals established in the MIS: improve mobility; increase transit ridership; target the highest commute corridors with emphasis on work and school trips; promote livable neighborhoods and community support.

In general, the project would provide residents of southeast San Jose more efficient access to the light rail system and improved connections and greater

mobility options throughout the Silicon Valley. For example, residents could travel to south San Jose, downtown San Jose, and to the cities of Santa Clara, Sunnyvale, and Mountain View via the Guadalupe, Tasman, and Capitol LRT lines. Linkages to the Caltrain commuter rail line, which provides service to San Francisco and to communities along the Peninsula, may also be accessed at intermodal connections throughout the system.

The project would also alleviate heavy traffic congestion in the Interstate 680 and U.S. 101 corridors and on major arterials; reduce the circulation impacts of increased peak-hour traffic; improve regional air quality by reducing automobile emissions; improve mobility options to employment, education, medical, and retail centers for corridor residents, in particular low-income, youth, elderly, disabled, and ethnic minority populations; and support local economic and land development goals.

III. Alternatives

The Capitol Expressway Light Rail Project is examining alternatives to be carried forward into the environmental analysis process. The No-Action Alternative will consist of the existing conditions, in accordance with both NEPA and CEQA requirements. The Build or LRT Alternative is the Capitol Expressway LRT Project.

The proposed alignment of the LRT project begins at the end of the Capitol [Avenue] LRT line, currently under construction. Starting on Capitol Avenue, at the intersection of Capitol and Wilbur Avenues in east San Jose, the LRT would transition to operate in the median of Capitol Expressway, at grade in an exclusive right-of-way with some potential for grade separation at locations to be determined during conceptual engineering. The line would extend to the Eastridge Mall area as the terminus of the first phase. The next phase(s) would continue along Capitol Expressway to the Capitol Station on the Guadalupe LRT line. In this portion of the alignment, the roadway would need to be widened to accommodate the LRT median. Along the alignment, nine conceptual station locations have been identified. More precise station locations and alignment options will be developed during preparation of the Draft EIS/EIR.

The EIS/EIR will also address any additional alternatives identified in the scoping process.

IV. Probable Effects

The purpose of the EIS/EIR is to fully disclose the environmental consequences of building and operating

the Capitol Expressway LRT Project in advance of any decisions to commit substantial financial or other resources towards its implementation. The EIS/EIR will explore the extent to which project alternatives and design options result in environmental impacts and will discuss actions to reduce or eliminate such impacts.

Environmental issues to be examined in the EIS/EIR include: changes in the physical environment (natural resources, air quality, noise, water quality, geology, visual); changes in the social environment (land use, business and neighborhood disruptions); changes in traffic and pedestrian circulation; changes in transit service and patronage; associated changes in traffic congestion; and impacts on parklands and historic resources. Impacts will be identified both for the construction period and for the long-term operation of the alternatives. The proposed evaluation criteria include transportation, environmental, social, economic, and financial measures, as required by current federal (NEPA) and state (CEQA) environmental laws and current Council on Environmental Quality and FTA guidelines.

To ensure that the full range of issues related to this proposed action are addressed and all significant issues identified, comments and suggestions are invited from all interested parties. Comments or questions concerning this proposed action and the EIS/EIR should be directed to VTA as noted above.

V. FTA Procedures

The EIS/EIR for the Capitol Expressway LRT Project will be prepared simultaneously with conceptual engineering for station and alignment options. The EIS/EIR/conceptual engineering process will address the potential use of federal funds for the proposed project, as well as assess the social, economic, and environmental impacts of station and alignment alternatives. Station designs and alignment alternatives will be refined to minimize and mitigate any adverse impacts identified.

After publication, the Draft EIS/EIR will be available for public and agency review and comment, and a public hearing will be held. Based on the Draft EIS/EIR and comments received, VTA will select a preferred alternative, which will be described in full detail in the Final EIS/EIR.

Issued on: September 14, 2001.

DEPARTMENT OF TRANSPORTATION

Federal Transit Administration

Over-the-road Bus Accessibility Program Announcement of Project Selection

AGENCY: Federal Transit Administration, DOT.

ACTION: Notice.

SUMMARY: The U.S. Department of Transportation (DOT) Federal Transit Administration (FTA) announces the Fiscal Year 2001 selection of projects to be funded under the Over-the-road Bus (OTRB) Accessibility Program, authorized by Section 3038 of the Transportation Equity Act for the 21st Century (TEA-21). The OTRB Accessibility Program makes funds available to private operators of over-the-road buses to help finance the incremental capital and training costs of complying with DOT's over-the-road bus accessibility rule, published in a **Federal Register** notice on September 24, 1998.

FOR FURTHER INFORMATION CONTACT: The appropriate FTA Regional Administrator for grant-specific issues; or Sue Masselink, Office of Program Management, 202-366-2053 for general information about the OTRB Accessibility Program.

SUPPLEMENTARY INFORMATION: In fiscal year 2001, a total of \$4.7 million was available for allocation: \$3 million for intercity fixed-route providers and \$1.7 million for all other providers, such as commuter, charter, and tour operator. A total of 84 applicants requested \$15.1 million: \$8.2 million was requested by intercity fixed-route providers, and \$6.9 million was requested by all other providers. Project selections were made on a discretionary basis, based on each applicant's responsiveness to statutory project selection criteria, fleet size, and level of funding received in previous years. Because of the high demand for the funds available, most applicants received less funding than they requested, although with the exception of some applicants that received funding in previous years, all qualified applicants received some funding. Each of the following 61 awardees, as well as the 23 applicants who were not selected for funding, will receive a letter that explains how funding decisions were made.

Notice of Preparation

To: _____
(Agency)

From: Santa Clara Valley Transportation Authority
(Agency)

(Address)

3331 North First Street
(Address)

San Jose, CA 95134-1906

Subject: Notice of Preparation of an Environmental Impact Statement/Environmental Impact Report

The Santa Clara Valley Transportation Authority will be the Lead Agency and will prepare an environmental impact report for the project identified below. We need to know the views of your agency as to the scope and content of the environmental information which is germane to your agency's statutory responsibilities in connection with the proposed project. Your agency will need to use the EIR prepared by our agency when considering your permit or other approval for the project. In accordance with National Environmental Policy Act (NEPA) requirements, an environmental impact statement also will be prepared. The Federal Transit Administration will be the Lead Agency under NEPA.

The project description, location, and the potential environmental effects are contained in the attached materials. A copy of the initial study (is is not) attached.

Due to the time limits mandated by State law, your response must be sent at the earliest possible date but *not later than 30 days* after receipt of this notice.

Please send your response to Mr. Thomas Fitzwater, Environmental Planning Manager, at the address shown above. We will need the name for a contact person in your **agency**.

Notice of Preparation

Environmental Impact Report: Capitol Expressway Light Rail Transit Project in San Jose, CA

Lead Agency: Santa Clara Valley Transportation Authority

Project Overview

The Federal Transit Administration (FTA) and the Santa Clara Valley Transportation Authority (VTA) intend to prepare an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA) and an Environmental Impact Report (EIR) in accordance with the California Environmental Quality Act (CEQA) for a proposed Light Rail Transit (LRT) line in the Capitol Expressway corridor. The proposed line and technology were selected following completion of the Downtown East Valley Major Investment Study (MIS) in August 2000. The MIS considered alternative modes of travel, alignments, and station locations in a 30-square mile study area. The MIS process resulted in a Preferred Investment Strategy that includes LRT improvements in the Capitol Expressway Corridor to improve direct transit service in an approximately 8-mile-long corridor in southeast San Jose, California (see attached map). The Capitol Expressway Project will be further evaluated during the conceptual engineering phase of the project and carried forward in the EIS/EIR. The EIS/EIR will evaluate a No-Action alternative, LRT alignment and station options, and additional alternatives that emerge from the scoping process. Scoping will be accomplished through correspondence and discussions with interested persons; organizations; federal, state and local agencies; and through a public meeting.

The project purpose is to improve public transit service in the downtown and East Valley areas of the City of San Jose by addressing the following specific goals established in the MIS: improve mobility; increase transit ridership; target the highest commute corridors with emphasis on work and school trips; promote livable neighborhoods and community support.

In general, the project would provide residents of southeast San Jose more efficient access to the light rail system and improved connections and greater mobility options throughout the Silicon Valley. For example, residents could travel to south San Jose, downtown San Jose, and to the cities of Santa Clara, Sunnyvale, and Mountain View via the Guadalupe, Tasman, and Capitol LRT lines. Linkages to the Caltrain commuter rail line, which provides service to San Francisco and to communities along the Peninsula, may also be accessed at intermodal connections throughout the system.

The project would also alleviate heavy traffic congestion in the Interstate 680 and U.S. 101 corridors and on major arterials; reduce the circulation impacts of increased peak-hour traffic; improve regional air quality by reducing automobile emissions; improve mobility options to employment, education, medical, and retail centers for corridor residents, in particular low-income, youth, elderly, disabled, and ethnic minority populations; and support local economic and land development goals.

Alternatives

The Capitol Expressway Light Rail Project is examining alternatives to be carried forward into the environmental analysis process. The No-Action Alternative will consist of the existing conditions, in accordance with both NEPA and CEQA requirements. The Build or LRT Alternative is the Capitol

Expressway LRT Project.

The proposed alignment of the LRT project begins at the end of the Capitol [Avenue] LRT line, currently under construction. Starting on Capitol Avenue, at the intersection of Capitol and Wilbur Avenues in east San Jose, the LRT would transition to operate in the median of Capitol Expressway, at grade in an exclusive right-of-way with some potential for grade separation at locations to be determined during conceptual engineering. The line would extend to the Eastridge Mall area as the likely terminus of the first phase. The future phase(s) would continue along Capitol Expressway to the Capitol Station on the Guadalupe LRT line. In this portion of the alignment, the roadway would need to be widened to accommodate the LRT median.

Along the alignment, nine conceptual station locations have been identified. More precise station locations and alignment options will be developed during preparation of the Draft EIS/EIR.

The EIS/EIR will also address any additional alternatives identified in the scoping process.

Probable Environmental Effects

The purpose of the EIS/EIR is to fully disclose the environmental consequences of building and operating the Capitol Expressway LRT Project in advance of any decisions to commit substantial financial or other resources towards its implementation. The EIS/EIR will explore the extent to which project alternatives and design options result in environmental impacts and will discuss actions to reduce or eliminate such impacts. Environmental issues to be examined in the EIS/EIR include: changes in the physical environment (natural resources, air quality, noise, water quality, geology, visual); changes in the social environment (land use, business and neighborhood disruptions); changes in traffic and pedestrian circulation; changes in transit service and patronage; associated changes in traffic congestion; and impacts on parklands and historic resources. Impacts will be identified both for the construction period and for the long-term operation of the alternatives. The proposed evaluation criteria include transportation, environmental, social, economic, and financial measures, as required by current federal (NEPA) and state (CEQA) environmental laws and current Council on Environmental Quality and FTA guidelines.

To ensure that the full range of issues related to this proposed action are addressed and all significant issues identified, comments and suggestions are invited from all interested parties. Comments or questions concerning this proposed action and the EIS/EIR should be directed to VTA as noted above.

For further information, contact: Mr. Thomas Fitzwater, Environmental Planning Manager, VTA, 3331 North First Street, San Jose, CA 95134-1906. Phone: (408) 321-5789. Fax: (408) 321-5787. People with special needs should contact Jennifer Rielly, Public Communications Specialist, VTA Community Outreach, at (408) 321-7575 or TDD only at (408) 321-2330.

San Jose, CA 95134-1906

Dear Mr. Fitzwater:

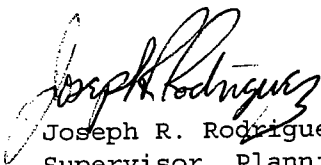

Our office has reviewed the Notice of Preparation (NOP) for the proposed Light Rail Transit (LRT), line in the Capital Expressway corridor for impacts to Federal Aviation Administration (FAA) programs. We note that the NOP indicates that the proposed right-of-way for the project runs parallel to the San Jose Reid-Hillview Airport runway system.

The San Jose Reid-Hillview Airport airspace should remain clear of any light rail structures. The proposed at grade light rail transit system does not appear to be penetrate the airport airspace as defined by Federal Aviation Regulation (FAR) Part 77, Objects Affecting Navigable Airspace. The lead project agency should require that a FAA airspace evaluation be completed prior to approval of site development plans. The enclosed FAA form 7460-1, Notice of Proposed Construction or Alteration, should be utilized to notify the FAA. The FAA will evaluate the data submitted with the form 7460-1 to determine if the project is or is not a hazard to aviation. Please note the notification requirements specified in paragraph 77.13 on FAA form 7460-1. I have enclosed a copy of FAR Part 77 and Advisory Circular 70/7460-1K, Obstruction Marking and Lighting for your information.

The FAA has recently issued a grant to the County for an Airport Master Plan Update. Any information you can provide regarding transit or surface access improvements within the airport area would be greatly appreciated. We ask that your office include the Airports District Office on the mailing list for future notification of proposed project alternatives for the transient station and railway alignment.

If you have any questions regarding airport design and the joint planning efforts of the FAA/Santa Clara County please contact Ms. Tara Tighe, Airport Planner, at (650) 876-2748.

Sincerely,

Joseph R. Rodriguez

RE: SCH# 2001092014 - Capitol Expressway Light Rail Transit project

Dear Mr. Fitzwater:

The Native American Heritage Commission has reviewed the above mentioned NOP. To adequately assess the project-related impact on archaeological resources, the Commission recommends the following action be required:

1. Contact the appropriate Information Center for a records search. The record search will determine:
 - Whether a part or all of the project area has been previously surveyed for cultural resources.
 - Whether any known cultural resources have already been recorded on or adjacent to the project area.
 - Whether the probability is low, moderate, or high that cultural resources are located within the project area.
 - Whether a survey is required to determine whether previously unrecorded cultural resources are present.
2. The final stage of the archaeological inventory survey is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
 - Required the report containing site significance and mitigation be submitted immediately to the planning department.
 - Required site forms and final written report be submitted within 3 months after work has been completed to the Information Center.
3. Contact the Native American Heritage Commission for:
 - A Sacred Lands File Check.
 - A list of appropriate Native American Contacts for consultation concerning the project site and assist in the mitigation measures.

Lack of surface evidence of archeological resources does not preclude the existence of archeological resources. Lead agencies should include provisions for accidentally discovered archeological resources during construction per California Environmental Quality Act (CEQA) §15064.5 (f). Health and Safety Code §7050.5 and Public Resources Code §5097.98 mandates the process to be followed in the event of an accidental discovery of any human remains in a location other than a dedicated cemetery and should be included in all environmental documents. If you have any questions, please contact me at (916) 653-4038.

Sincerely,

Debbie Pilas-Treadway
Associate Governmental Program Analyst

VTA
ENVIRONMENTAL ANALYSIS

2001 SEP 26 P 2:15

IN REPLY REFER TO:
PPN 2878

September 20, 2001

Mr. Thomas Fitzwater
Environmental Planning Manager
Santa Clara Valley Transportation Authority
3331 North First Street
San Jose, California 95134-1906

Dear Mr. Fitzwater:

Thank you for the opportunity to review the Notice of Preparation for a Draft Environmental Impact Report for the Capitol Expressway Light Rail Transit Project in San Jose, California. The enclosures are intended to assist you in the early environmental review of this proposal. Future consultation with the U.S. Fish and Wildlife Service (Service) may be required under the Fish and Wildlife Coordination Act if project activities are anticipated to impact jurisdictional wetlands, and/or the Endangered Species Act if project activities are anticipated to affect federally listed species.

Enclosure A provides a list of sensitive species that may occur in or near the project site. The Service recommends that surveys be completed by a qualified biologist on the proposed project site to confirm the presence or absence of special-status species or their habitats. Enclosure B recommends general guidelines for identifying and mitigating project impacts to fish, wildlife, and their habitats. The Council on Environmental Quality developed regulations for implementing the National Environmental Policy Act, and defines mitigation to include: (1) avoiding the impact; (2) minimizing the impact; (3) rectifying the impact; (4) reducing or eliminating the impact over time; and (5) compensating for impacts. The Service supports and adopts this definition of mitigation and considers the specific elements to represent the desirable sequence of steps in the mitigation planning process. Accordingly, we maintain the best way to mitigate adverse biological impacts is avoidance when at all possible.

We encourage you to use these guidelines to develop a comprehensive environmental document that addresses these needs. If you have any questions regarding these comments, please contact Jerry Bielfeldt in the Wetlands Branch at (916) 414-6584.

Sincerely,

Dale A. Pierce
Acting Field Supervisor

| (**) <i>Extinct</i> <i>Critical Habitat</i> | Possibly extinct. Area essential to the conservation of a species. |

ENCLOSURE B

The goal of the U.S. Fish and Wildlife Service is to conserve, protect and enhance fish, wildlife, and their habitats by timely and effective provision of fish and wildlife information and recommendations. To assist us in accomplishing this goal, we would like to see the items described below discussed in your environmental documents for the proposed project.

Project Description. The document should very clearly state the purposes of, and document the needs for, the proposed project so that the capabilities of the various alternatives to meet the purposes and needs can be readily determined.

A thorough description of all permanent and temporary facilities to be constructed, and all work to be done as a part of the project should be included. The document should identify any associated new access roads, equipment staging areas, and gravel processing facilities. Figures accurately depicting proposed project features in relation to natural features (such as streams, wetlands, riparian areas, and other habitat types) in the project area should be included.

Affected Environment. The document should show the location of, and describe, all vegetative cover types in the areas potentially affected by all project alternatives and associated activities. Tables with acreages of each cover type with and without the project for each alternative would also be appropriate. We recommend that all wetlands in the project area be delineated and described according to the classification system found in the Service's Classification of Wetlands and Deepwater Habitats of the United States (Cowardin 1979). The Service's National Wetland Inventory maps would be one starting point for this effort.

The document should present and analyze a full range of alternatives to the proposed project. At least one alternative should be designed to avoid all impacts to wetlands, including riparian areas. Similarly, within each alternative, measures to minimize or avoid impacts to wetlands should be included.

Lists of fish and wildlife species expected to occur in the project area should be in the document. The lists should also indicate whether or not each species is a resident or migrant, and the period(s) of the year it would be expected in the project area.

Environmental Consequences. The sections on impacts to fish and wildlife should discuss impacts from vegetation removal (both permanent and temporary), filling or degradation of wetlands, interruption of wildlife migration corridors, and disturbance from trucks and other machinery during construction and/or operation. These sections should also analyze possible impacts to streams from construction of outfall structures, pipeline crossings, and filling. Impacts on water quality, including nutrient loading, sedimentation, toxics, biological oxygen demand, and temperature in receiving waters should also be discussed in detail along with the resultant effects on fish and aquatic invertebrates. Discussion of indirect impacts to fish, wildlife, and their habitats, including impacts from growth induced by the proposed project, should also be addressed in the document. The impacts of each alternative should be discussed in sufficient detail to allow comparison between the alternatives.

The cumulative impacts of the project, when viewed in conjunction with other past, existing, and foreseeable projects, need to be addressed. Cumulative impacts to fish, wildlife, wetlands and other habitats, and water quality should be included.

Mitigation Planning. Under provisions of the Fish and Wildlife Coordination Act (Coordination Act), the Service advises the U.S. Army Corps of Engineers on projects involving dredge and fill activities in "waters of the United States", of which wetlands and some riparian habitats are subcategories. Since portions of this proposal may ultimately require a Corps permit, the Service will subsequently be involved under the Coordination Act. Therefore, if you have not done so already, we suggest you or your representative consult the Corps regarding onsite wetlands and related habitats that may fall under their jurisdiction, and include this information in the draft document. When reviewing Corps public notices, the Service generally does not object to projects meeting the following criteria:

1. They are ecologically sound;
2. The least environmentally damaging reasonable alternative is selected;
3. Every reasonable effort is made to avoid or minimize damage or loss of fish and wildlife resources and uses;
4. All important recommended means and measures have been adopted, with guaranteed implementation to satisfactorily compensate for unavoidable damage or loss consistent with the appropriate mitigation goal; and
5. For wetlands and shallow water habitats, the proposed activity is clearly water dependent and there is a demonstrated public need.

The Service may recommend the "no project" alternative for those projects which do not meet all of the above criteria, and where there is likely to be a significant fish and wildlife resource loss.

When projects impacting waterways or wetlands are deemed acceptable to the Service, we recommend full mitigation for any impacts to fish and wildlife. The Council on Environmental Quality regulations for implementing the National Environmental Policy Act define mitigation to include: 1) Avoiding the impact; 2) minimizing the impact; 3) rectifying the impact; 4) reducing or eliminating the impact over time; and 5) compensating for impacts. The Service supports and adopts this definition of mitigation and considers the specific elements to represent the desirable sequence of steps in the mitigation planning process. Accordingly, we maintain the best way to mitigate adverse biological impacts is to avoid them altogether.

The document should describe all measures proposed to avoid, minimize, or compensate for impacts to fish and wildlife and their habitats. The measures should be presented in as much detail as possible to allow us to evaluate their probable effectiveness.

Because of their very high value to migratory birds, and their ever-increasing scarcity in California, our mitigation goal for wetlands (including riparian and riverine wetlands) is no net loss of in-kind habitat value or acreage (whichever is greater).

In those situations where impacts are unavoidable, adequate mitigation should be provided to offset these impacts. To determine mitigation credits for a given mitigation project, we evaluate the expected future conditions on the mitigation site in the absence of mitigation actions, and then compare those conditions to conditions we expect to develop with implementation of the mitigation plan.

For unavoidable impacts, to determine the mitigation credits available for a given mitigation project, we evaluate what conditions would exist on the mitigation site in the future in the absence of the mitigation actions, and compare those conditions to the conditions we would expect to develop on the site with implementation of the mitigation plan.

Mitigation habitat should be equal to or exceed the quality of the habitat to be affected by the project. Baseline information would need to be gathered at the impact site to be able to quantify this goal in terms of plant species diversity, shrub and tree canopy cover, stems/acre, tree height, etc. The ultimate success of the project should be judged according to these same measurements at the mitigation site.

Criteria should be developed for assessing the progress of the project during its developmental stages as well. Assessment criteria should include rates of plant growth, plant health, and evidence of natural reproduction. Success criteria should be geared toward equaling or exceeding the quality of the highest quality habitat to be affected. In other words, the mitigation effort would be deemed a success in relation to this goal if the mitigation site met or exceeded habitat measurements at a "model" site (plant cover, density, species diversity, etc.).

The plan should present the proposed ground elevations at the mitigation site, along with elevations in the adjacent areas. A comparison of the soils of the proposed mitigation and adjacent areas should also be included in the plan, and a determination made as to the suitability of the soils to support habitats consistent with the mitigation goals.

Because wetland ecosystems are driven by suitable hydrological conditions, additional information must be developed on the predicted hydrology of the mitigation site. The plan should describe the depth of the water table, and the frequency, duration, areal extent, and depth of flooding which would occur on the site. The hydrologic information should include an analysis of extreme conditions (drought, flooding) as well as typical conditions.

The plan must include a timeframe for implementing the mitigation in relation to the proposed project. We recommend that mitigation be initiated prior to the onset of construction. If there will be a substantial time lag between project construction and completion of the mitigation, a net loss of habitat values would result, and more mitigation would be required to offset this loss.

Generally, monitoring of the mitigation site should occur annually for at least the first five years, biennially for years 6 through 11, and every five years thereafter until the mitigation has met all success criteria. Remediation efforts and additional monitoring should occur if success criteria are not met during the first five years. Some projects will require monitoring throughout the life of the project. Reports should be prepared after each monitoring session.

The plan should require the preparation of "as-built" plans. Such plans provide valuable information, especially if the mitigation effort fails. Similarly, a "time-zero" report should be mandated. This report would describe exactly what was done during the construction of the mitigation project, what problems were encountered, and what corrections or modifications to the plans were undertaken.

The plan should detail how the site is to be maintained during the mitigation establishment period, and how long the establishment period will be. It will also be important to note what entity will perform the maintenance activities, and what entity will ultimately own and manage the site. In addition, a mechanism to fund the maintenance and management of the site should be established and identified. A permanent easement should be placed on the property used for the mitigation that would preclude incompatible activities on the site in perpetuity.

Finally, in some cases, a performance bond may be required as part of the mitigation plan. The amount of the bond should be sufficient to cover the costs of designing and implementing an adequate mitigation plan (and purchasing land if needed) should the proposed plan not succeed.

RE: Notice of Preparation of an Environmental Impact Statement/Environmental Impact Report

Dear Mr. Fitzwater:

Thank you for the opportunity to comment on the Notice of Preparation of this EIS/EIR for the Capitol Expressway Light Rail Transit Project in San Jose, CA. The County of Santa Clara Parks and Recreation Department comments are focused on the following:

TRAILS:

- **Regional Trail Route R5-C (Bay Area Ridge Trail: El Sombroso/Penitencia) and Sub-regional Trail Route S5 (Coyote Creek/Llagas Creek Trail)**

These trails share the same alignment in the project area, so comments are the same for both trail routes. According to the map enclosed with the NOP, the Capitol Expressway Light Rail Alignment crosses Trail Routes R5-C and S5 between McLaughlin Ave and Senter Rd. Designated as a regional trail in the *Countywide Trails Master Plan*, Trail Route R5-C is roughly 40 miles long. It extends from Almaden Quicksilver County Park in south San Jose to Santa Teresa County Park, and then northward along Coyote and Penitencia Creeks to Alum Rock Park in north San Jose. Sub-regional Trail Route S5 is approximately 50 miles from the Alameda County border in Milpitas to the San Benito County border south of Gilroy. The segment of trail in the project vicinity is intended for hiking, off-road bicycle, and equestrian use, and is under the jurisdiction of the City of San Jose. Any development in the vicinity of these two trails should take into account existing and future uses and be coordinated with the City of San Jose.

- **Trail Route C22- Silver Creek Loop Trail**

This trail route is roughly 10 miles long and is located near Lake Cunningham Park. The segment of trail in the project vicinity is located along Lower Silver Creek and Thompson Creek, adjacent to Capitol Expressway, and is under the jurisdiction of the City of San Jose. According to the *Countywide Trails Master Plan*, this trail segment is intended for hiking, on-road, and off-road bicycle use. Any development in the vicinity of this trail should take into account existing and future uses and be coordinated with the City of San Jose.

Overall, we commend the VTA in its efforts to provide an improved transportation network that will create livable communities for the future. If you have any questions regarding the above noted comments, please contact me at (408) 358-3741 x192 or via EMAIL at kelly.gibson@mail.prk.co.scl.ca.us

Respectfully,

Kelly Gibson

Mr. Tom Fitzwater, Environmental Planning Manager
Santa Clara Valley Transportation Authority
3331 North First Street
San Jose, CA 95134-1906

Dear Mr. Fitzwater:

Capitol Expressway Light Rail Transit Project – Notice of Preparation (NOP)

Thank you for including the California Department of Transportation (Department) in the environmental review process for the above referenced project. We have examined the NOP and have the following comments to submit:

1. This project proposes to improve public transit service in the downtown and East Valley areas of the City of San Jose by extending the Capitol Avenue Light Rail Transit Line to the Eastridge Mall area. Within these limits the Department has existing Traffic Operations Systems (TOS) and Ramp Metering equipment. Enclosed is a list of the existing Ramp Meter locations with Mainline Traffic Monitoring Stations and a list of TOS equipment. These TOS/ Ramp Metering locations need to be kept operational during all phases of construction.
2. The Environmental Impact Report (EIR) should address any temporary construction-related and post-construction Water Quality impacts, and include mitigation measures for these impacts. The following are requirements that are applicable to all construction/ improvement projects within the Departments' right-of-way:
 - Projects shall adhere to the conditions of the Departments' statewide NPDES Permit CAS #000003, Order #99-06-DWQ, issued by the State Water Resources Control Board (SWRCB). Adherence to the compliance requirements of the NPDES General Permit CAS #000002, Order #99-08-DWQ, for General Construction Activities is also required. Copies of these permits may be obtained from the SWRCB web site at <http://www.swrcb.ca.gov>.
 - Incorporation of Permanent Control Measures (PCM) or drainage improvements for water quality benefit shall be considered for all highway/ transportation improvements, as required by section F.4 of the Departments' statewide NPDES permit.

- Incorporation of Treatment Best Management Practices into the design and operations of all highway/ transportation projects is also required under Section 4.4 of the Storm Water Management Plan which implements the Departments' statewide NPDES permit.
 - The proposed projects' work limits are close to water sensitive areas (Silver Creek, Coyote Creek, Guadalupe River) that may be affected during construction activities. If that is the case, U.S. Army Corps of Engineers and/or California Department of Fish and Game permits, and a 401 Water Quality Certification from the San Francisco Bay Regional Water Quality Control Board (RWQCB) may be required.
3. An Initial Site Investigation (ISA) and a Preliminary Site Investigation (PSI) for hazardous materials will need to be conducted and reviewed by the Department.
 4. For your information, the proposed project will cross through and near State right-of-way (ROW) at the intersections of Capitol Expressway with U.S. Highway 101, State Route (SR) 82, and SR 87.
 5. An encroachment permit will be required for performing work and/or traffic control within State right-of-way (ROW). To apply for an encroachment permit, submit a completed application with appropriate environmental documentation and five (5) sets of plans (in metric units) which also show State ROW to the following address:

Mr. Sean Nozzari, District Office Chief
Office of Permits
Department of Transportation, District 04
P. O. Box 23660
Oakland, CA 94623-0660

Should you require further information or have any questions regarding this letter, please call Maija Cottle, of my staff at (510) 286-5737.

Sincerely,

RANDELL H. IWASAKI
Acting District Director

By 

JEAN C. R. FINNEY

ENV. ANALYSIS

2001 OCT -9 P 2:01

October 4, 2001

Mr. Thomas Fitzwater
Environmental Planning Manager
Santa Clara Valley Transportation Authority
3331 North First Street
San Jose, CA 95134-1906

Dear Mr. Fitzwater:

Subject: Notice of Preparation for an Environmental Impact Report for the Capitol Expressway Light Rail Transit Project

The Santa Clara Valley Water District (District) has reviewed the subject document, received by the District on September 4, 2001. The proposed project may affect any or all of the following District facilities:

- Lower Silver Creek
- Coyote Creek
- Thompson Creek
- Norwood Creek
- Canoas Creek
- Guadalupe River

Our comments in our letter dated April 25, 2001, are still applicable. A copy of that letter is enclosed.

The District has the following additional comments:

1. As part of the design for bank stabilization, consideration must be given to the potential effects of the project on other parts of the creek, such as the bank opposite the proposed work and the banks immediately upstream and downstream. As streambanks are changed, even by slope protection, water flows can change, resulting in changes to the stream channel.
2. Water flows in the creek must be maintained during construction. Any flow diversion for proposed work in the channel must be coordinated with District groundwater recharge activities.
3. Construction activities can easily impact water quality. Specific measures should be proposed to address these impacts at the various locations of this project. In addition, post-construction measures should be considered. There should be measures to direct runoff from parking lots

and roofs to appropriate landscaping to allow pollutants to be reduced in the water that eventually is discharged to the adjacent District facilities.

4. Any proposed work within a creek is also subject to review by the U.S. Army Corps of Engineers, the California Department of Fish and Game, and the California Regional Water Quality Control Board, San Francisco Bay Region.

In accordance with District Ordinance 83-2, any plans for construction over or adjacent to the District's facilities should be sent to us for review and issuance of a permit.

Please reference File No. 28140 on further correspondence regarding the project. If you have any questions or comments, please call me at (408) 265-2607, extension 2494.

Sincerely,

Theodore Hipol
Assistant Engineer
Community Projects Review Unit

Re: Request for Facilities
Information for the Capitol
Light Rail Project

April 25, 2001

Mr. Michael Lightstone
Utility Coordinator
Valley Transportation Authority
3331 North First Street
San Jose, CA 95134-1906

Dear Mr. Lightstone:

Subject: Request for Facilities Information for the Capitol Light Rail Project

The Santa Clara Valley Water District (District) has reviewed your request for information regarding the location of District facilities affected by the proposed project, received February 14, 2000. We apologize for the delay in our response.

The proposed project crosses the following three District facilities: Lower Silver Creek, Coyote Creek, and Canoas Creek. Enclosed are as-builts and construction plans to assist in any improvement plans. As-builts for Thompson Creek and additional construction plans for Lower Silver Creek have also been enclosed to show any improvements adjacent and longitudinal to the creeks. All information taken from the plans should be verified in the field.

Currently, proposed improvements for Lower Silver Creek are scheduled for year 2003.

The proposed light rail alignment will cross Canoas Creek, which is contained in a 12- by 9-foot double reinforced concrete box culvert under Capital Expressway. Canoas Creek currently experiences flooding during events as frequent as 7-year floods. It will be important for the Valley Transportation Authority (VTA) to work closely with the District during the design of any project improvements which may affect flooding in the Canoas Creek watershed or impact our ability to construct flood control improvements in the future.

Improvements that may affect the existing flooding include lengthening, widening, or replacement of the existing box culvert; changes to the existing drainage patterns; and increasing the existing storm drain capacity. Existing drainage patterns should not be altered as part of this project. Any increases in runoff or alteration of the existing storm drain capacity must be mitigated. Proposed improvements to the box culvert should be submitted to the District early in the design so that we can work together with the VTA to make sure that the improvements do not impact flooding, delay the light rail project, or hinder our ability to construct flood control improvements in the future.

In accordance with District Ordinance 83-2, plans for any construction over or adjacent to the District's facilities should be sent to us for review and issuance of a permit.

Highstone

Santa Clara Valley Transportation Authority
3331 North First Street, Building B
San Jose, CA 95134-1906

**SUBJECT: NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL
IMPACT REPORT/ENVIRONMENTAL IMPACT STATEMENT
(EIR/EIS) FOR THE CAPITOL EXPRESSWAY LIGHT RAIL TRANSIT
PROJECT (FILE NO. OA01-09-019)**

Dear Mr. Molseed:

Thank you for the opportunity to review and comment on the Notice of Preparation (NOP) of a Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS) for the Capitol Expressway Light Rail Transit (LRT) Project. We anticipate that the EIR/EIS will address all appropriate environmental issues such as Land Use, Traffic and Circulation, Parking, Noise, Air Quality, Cultural Resources, Hazardous Materials, Water Quality, Riparian/Biological Resources, Geology and Soils, Visual/Aesthetics, Energy, Cumulative Impacts and Construction Impacts. The EIR/EIS should include a "Uses of the EIR/EIS" section within the document to address future project approvals that may be required by the VTA and by other agencies with regulatory authority. City staff requests that the following specific environmental issues be addressed in the EIR/EIS.

Maps: Please include detailed project maps.

Noise and Vibration: Analysis of noise and vibration impacts on adjacent and nearby properties should also include noise and vibration impacts on all approved and pending development projects in San Jose. Noise and vibration impacts generated by construction activities and LRT operations upon sensitive receptors, historic buildings, residences and commercial/retail properties should be included in the EIR analysis.

Traffic: The EIR/EIS should analyze potential transportation impacts, including impacts on emergency vehicle access and response times, parallel transportation corridors, potential for generating cut-through traffic in residential neighborhoods, as well as traffic control and mitigation during construction and commute periods. The EIR/EIS should recognize the efforts of the City's Traffic Calming Policy and the Strong Neighborhoods Initiative in the development traffic impacts mitigation alternatives. Operational delays to traffic movement should be

Mr. Roy Molseed

RE: NOP FOR CAPITOL EXPRESSWAY LIGHT RAIL TRANSIT PROJECT

October 30, 2001

Page 2

reviewed at all signalized intersections affected by LRT crossings. Turning movement studies at affected signalized intersections should also be included in the EIR/EIS.

Impacts to on street parking and loading zones should be quantified and mitigated to the extent possible.

Operational information such as the daily hours of LRT project operation as well as changes to bus routes and stops should be included.

The EIR/EIS should also recognize that all work performed on City streets would be required to adhere to City of San Jose Standard Plans and Specifications (7/92 rev.), including all revisions and amendments to the City's Standard Plans and Specifications, and all related policies, ordinances and codes. The EIR/EIS should also address pedestrian and bicycle access and safety issues. Appropriate mitigation measures should be identified in the document, as warranted.

Light and Glare: The EIR/EIS should specify that all lighting for the proposed project is in accordance with lighting levels and shielding pertaining to the U.C. Lick Observatory light bounce-back guidelines.

Biological Resources: The EIR/EIS should include a thorough analysis of impacts on biological resources, including impacts on local creeks and riparian corridors as well as impacts on wetlands, special status plants and animals, etc. as warranted. There may be potential impacts to heritage and ordinance-sized trees along the proposed corridor; therefore, tree removal and biological resource impact mitigation should also be addressed in the EIR/EIS. The VTA should coordinate with the City of San Jose Arborist (277-2762) for tree replacement and enhancement guidelines.

Water Quality: The EIR/EIS should address non-point source protection measures and design mitigation for any new non-permeable surfaces and for bridge crossings over creeks.

Utilities and Services: The EIR/EIS should address utility relocation and coordination and interruption of services. In accordance with City policy, all overhead utilities should be undergrounded with the project.

Construction: The EIR/EIS should address construction impacts such as noise and dust control and storm water runoff during construction activities. Non-point source water pollution caused by construction run-off should be prevented from entering street storm drains and natural waterways. The daily hours of construction activities and construction impact mitigation should be identified in the EIR/EIS. The EIR should require the preparation of a Construction Mitigation Plan to address the following:

- VTA should assign full time staff to deal with business and resident complaints during construction.

Mr. Roy Molseed

RE: NOP FOR CAPITOL EXPRESSWAY LIGHT RAIL TRANSIT PROJECT

October 30, 2001

Page 3

- Business disruption should be minimized during construction. This could be achieved by requiring nighttime work when businesses are not open. Nighttime work may require special noise and vibration mitigation conditions. Residential and commercial impacts should be mitigated and should be closely monitored.
- A traffic diversion plan should be required.
- A business retention plan should be required.

If possible, we would appreciate receiving four copies of the Draft EIR/EIS including all technical appendices when you refer the document to us for review and comment. We will then provide copies to the City of San Jose Department of Public Works, the Department of Transportation and the Redevelopment Agency for their review. We would also ask that you please include a copy of any Initial Studies that may have been prepared for the project.

Thank you for the opportunity to review and comment on the NOP for the Capitol Expressway Light Rail Transit Project. The City of San Jose looks forward to reviewing the Draft EIR/EIS as soon as it becomes available for public agency review.

Sincerely,

Janis Moore
Planner II

Dennis Korabiak

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IX
75 Hawthorne Street
San Francisco, CA 94105-3901

November 1, 2001
Jerome Wiggins, Office of Planning and Program Development
Federal Transit Administration
201 Mission Street, Room 2210
San Francisco, CA 94105

Dear Mr. Wiggins:

The U.S. Environmental Protection Agency (EPA) has reviewed the Notice of Intent (NOI) to prepare an Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the **Capitol Expressway Light Rail Transit Project** in San Jose, California. Our comments are provided pursuant to the National Environmental Policy Act (NEPA), the Council on Environmental Quality's NEPA Implementation Regulations at 40 CFR 1500 – 1508, and Section 309 of the Clean Air Act.

The Federal Transit Administration (FTA) and the Santa Clara Valley Transportation Authority (VTA) propose a Light Rail Transit (LRT) line in the Capitol Expressway corridor. The proposed line and technology were selected following the completion of the Downtown East Valley Major Investment Study (MIS) in August, 2000. The MIS resulted in a Preferred Investment Strategy that includes LRT improvements in the Capitol Expressway Corridor to improve direct transit service in an approximately 8-mile long corridor. The purpose of the project is to improve public transit service in the downtown and East Valley areas of the City of San Jose. The NOI identifies a No Build and a Build Alternative. The Build Alternative under consideration is the Capitol Expressway LRT. This alternative would begin at the end of the Capitol Avenue LRT line and would transition to operate in the median of Capitol Expressway, at grade in an exclusive right-of-way with some potential for grade separation. Nine conceptual stations have been identified. The NOI also indicates that more precise station locations and alignment options will be developed during preparation of the EIS/EIR.

We appreciate this opportunity for early involvement in the environmental impact assessment of the Capitol Expressway LRT project. EPA applauds the project objectives to increase transit ridership, reduce congestion, improve regional air quality, and promote livable neighborhoods. To assist in the scoping process, we have identified several issues we would like to draw to your attention in the preparation of the EIS. Our specific comments are listed below.

Range of Alternatives

The NOI identifies a No Action Alternative, a single No Build Alternative, and nine conceptual

stations. The NOI also indicates that more precise station locations and alignment options will be developed during preparation of the EIS/EIR. This investigation of additional alternatives is an essential, and required, component of the NEPA process. *Forty Most Asked Questions Concerning CEQ's NEPA Regulations (1981, 1986)* (1a.) states, "The phrase 'range of alternatives' refers to the alternatives discussed in environmental documents. It includes all reasonable alternatives, which must be rigorously explored and objectively evaluated, as well as those other alternatives, which are eliminated from detailed study with a brief discussion of the reasons for eliminating them." The EIS/EIR should consider and discuss a broad range of alternatives that meets the project Purpose and Need.

Park and Ride Lots

The map provided with the Notice of Preparation seems to indicate that two park-and-ride lots are under consideration along the alignment. While EPA understands the operational importance of providing easy patron access to the transit facility, EPA strongly encourages strategies to reduce vehicle miles traveled. Therefore, EPA recommends minimizing park-and-ride lots to the greatest extent possible and providing strong justification for the need for park-and-ride lots in the environmental document. The EIS/EIR should:

- Provide a clear summary of the methodology used to determine daily transit ridership, mode of access, and the split between auto-based trips (park-and-ride and kiss-and-ride).
- Discuss who the park-and-ride facilities would serve, i.e. where do the park-and-ride riders originate. Consider whether there is a disproportionate impact to the surrounding community from the park-and-ride lots.
- Include an analysis of the potential for induced parking demand and associated traffic circulation and air quality impacts.
- Discuss in detail the multi-modal options for linking to the proposed project.
- Consider using park-and-ride funds to improve multi-modal options for linking to the proposed project.
- Any park-and-ride facility that is provided should include features to reduce non-point source pollution from the parking facilities, such as specific landscape designs and techniques that will reduce stormwater runoff and provide on-site treatment.

Water Quality

The map provided with the Notice of Preparation indicates that the alignment under consideration crosses Coyote Creek. Coyote Creek is listed as an impaired water body under the Total Daily Maximum Load (TMDL) Program established under Section 303(d) of the Clean Water Act. Diazanone from stormwater runoff is found in Coyote Creek.

While the area around Coyote Creek is urbanized and is subject to stormwater runoff from surrounding development, all efforts should be taken to reduce polluted stormwater runoff from the project into this creek. The EIS/EIR should:

- Describe the TMDL status for Coyote Creek. (Refer to the State of California's Water Resources Control Board Web page for the 1998 TMDL listing for Coyote Creek. (<http://www.swrcb.ca.gov/plnspols/wqplans/303d98.pdf>))
- Describe current efforts to reduce pollutants in Coyote Creek and how this project will be coordinated with those efforts.
- Describe required permits for project construction and operation.
- Provide examples of the Best Management Practices that will be implemented during project construction and operation to protect water quality.
- Describe any water quality monitoring programs that may be implemented.

Air

EPA recognizes that this project provides significant air quality benefits by providing alternatives to driving. However, potential air quality impacts must also be addressed. The proposed project is located in the Bay Area Air Quality Management District, which has been designated a moderate nonattainment area for the one-hour ozone standard. Because the new eight-hour ozone standard is more stringent than the one-hour standard, it is very likely that the Bay Area will also be in nonattainment for the new eight-hour ozone standard. In the course of development of this project, the new eight-hour standard may have bearing on the project. Therefore, it would be useful, and appropriate under the public disclosure requirements of NEPA, to include a discussion of the implications of the new eight-hour ozone standard with respect to this project. The existing nonattainment designation for the Bay Area also directs that the EIS/EIR demonstrate that the project meets Transportation Conformity requirements.

While the project area is in attainment for the federal standard for particulate matters less than 10 microns (PM10), the Bay Area is in violation of the State PM10 standard. In addition, the State recently approved standards to further reduce diesel emissions. EPA is also aware of the serious health effects "fine" particulates can cause, as reflected in EPA's new standard for particulate matter less than 2.5 microns in diameter (PM2.5). While EPA has not designated areas as nonattainment for PM2.5, EPA urges project proponents to reduce particulate emissions to the greatest extent possible. The EIS/EIR will need to disclose whether federal and State air quality standards are exceeded, even if those exceedences are temporary. In such instances, the EIS/EIR needs to include appropriate mitigation measures. The EIS/EIR should:

Affected Environment

- In the "Affected Environment" chapter, include a discussion of the new eight-hour ozone standard, as well as the new PM2.5 standard. To the extent that monitoring data is available on these two criteria pollutants, include that information in the EIS/EIR.

Construction

- Reduce the use of diesel-powered equipment.
- Specify the duration and concentration of air emissions by pollutant and location

for each phase of project construction.

- Identify sensitive receptors in the project area, such as children, elderly, infirm, and athletes, and schedule construction to minimize impact to these populations.
- Include mitigation measures that detail how diesel emissions will be minimized for each phase of project construction. For example, require contractors to keep the equipment fine-tuned or use alternative fueled vehicles.
- Include a fugitive dust control plan.
- Address how traffic congestion related to project construction can contribute to increased levels of carbon monoxide, especially at already congested intersections.

Operation

- Since the project area is in nonattainment for ozone, the project should be included in a conforming Transportation Plan and Transportation Improvement Program before the NEPA process is completed.

Transit Operation

One of the greatest benefits of this project is to improve transit service and to reduce vehicle miles traveled. EPA supports further efforts to improve non-motorized access to the proposed project, such as:

- Design the new facilities to be pedestrian and bicycle-friendly.
- Support policies that will increase density and mixed-use around the transit stations.

Environmental Justice

Executive Order 12898 requires an analysis of environmental justice issues associated with the proposed project. Clearly document the implementation of Executive Order 12898.

Pollution Prevention

The Resource Conservation and Recovery Act (RCRA) Section 6002 requires federal, State, local agencies, and their contractors, that use appropriated federal funds, to purchase EPA-designated recycled materials, including EPA-designated transportation, construction and landscaping products. In the EIS/EIR, describe how the project will meet these pollution prevention requirements. For further information, see EPA's Web site at <http://www.epa.gov/cpg>.

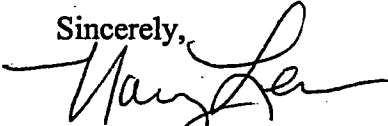

Invasive Species

Executive Order 13112 on Invasive Species calls for the restoration of native plant and tree species. To the extent that this project will entail new landscaping, the EIS/EIR should describe how the project will meet the requirements of Executive Order 13112 by using native species.

Thank you for this opportunity to comment. When the Draft EIS/EIR is complete, please

send two copies to the address above (mail code: CMD-2). If you have any questions or comments, please feel free to contact me at 415-972-3846 or blazej.nova@epa.gov

Sincerely,

so

Subject: Notice of Preparation
Capitol Expressway Light Rail Transit (LRT) Project

Dear Mr. Fitzwater,

We have reviewed the Notice of Preparation of an Environmental Impact Statement/Environmental Impact Report for the subject project. Our comments are as follows.

- 1) Attached is our May 15, 2000 letter from Mr. Michael Murdter, Director of Roads and Airports Department expressing our views/concerns on the planned LRT project along Capitol Expressway.
- 2) Obviously, there are discussions on this project at different levels. At staff level, we feel it important to note that the LRT project should not reduce the number of existing lanes, nor reduce the length of, or eliminate the left turn lanes on Capitol Expressway, unless supported by a traffic analysis as indicated in the above-mentioned letter.
- 3) The EIR should discuss the alternatives to grade crossings along Capitol Expressway intersections and the LRT impacts and necessary mitigations.

Thank you for the opportunity to review and comment on this project. If you have any questions, please call me at (408) 573-2463.

Sincerely,

A handwritten signature in black ink, appearing to read "Sean Quach".

San Jose, California 95110-1302

May 15, 2000

Ms. Julie Render
Principal Transportation Planner
Santa Clara Valley Transportation Authority
3331 North First Street
San Jose, CA 95134-1906

Subject: Downtown/East Valley Major Investment Study

Dear Ms. Render:

We appreciate the time you and your staff have taken advising us of the subject study. We are in receipt of your letters of March 30, 2000 and April 10, 2000, transmitting various related documents. Our comments follow:

As you are aware, Capitol Expressway is an important transportation facility that is operated and maintained by the County. The County has long planned for HOV lanes on Capitol, and participated in the design and construction of the currently existing HOV lanes east of US101 as part of the Evergreen Development traffic mitigation.

Given our in place HOV facilities, we have reviewed your documents with interest to see how these existing investments play a part in the planned transportation improvements. Conceptual Alternatives 8, 9, 10, and 16 have elements that include use of the existing HOV lanes. None of the options appears to include full build out of the planned Capitol HOV lanes (Alternative 16 is so vaguely described it is difficult to tell what might be included), none include direct HOV connector ramps at Capitol, and none discuss HOV connection to northbound I-680. Despite this, it is noted that in "Working Paper: Evaluation of Conceptual Alternatives (December 1999)" Alternate 8 has as many positive scorings as the LRT options, and is recommended for further study. Alternative 10 is also recommended for further study, but not Alternative 9, which appears from the scoring to be the better alternative. We look forward to review of whatever further analysis is done.

Based on our meetings, communication, and the documents reviewed to date we are concerned there may be a desire to conclude positively for the LRT option regardless of quantifiable study results. The preliminary ridership numbers don't seem to justify the removal of existing transportation capacity at a time when transportation demand is growing. Our preferred alternative is the alternative which best uses the reasonable rights-of-way limits of Capitol to provide the most effective transportation corridor (effective= expressway person capacity/ expressway person delay) with the most efficient use of transportation funds (efficient= expressway person capacity/ improvement costs).

As discussed at our recent meetings, we share your concern with traffic service levels at Capitol and Story Road and look forward on working with VTA, the City of San Jose, and the local community on identification of possible improvements.

If VTA proceeds with further development of the LRT option, we feel it is important that the expressway be studied intersection by intersection for appropriate safety auxiliary lane/ turning pocket storage provisions. Impacts of removal of a lane on Capitol to add LRT will be worsened if provisions for turning movements are not carefully considered and backups block through lanes.

The LRT cross section developed in "Refined Definition of Conceptual Alternatives SUMMARY WORKING PAPER" (Figure 11) does not address the prior comment. We look forward to working with your designers as more specific plans are developed. At present we have the following concerns with the proposed section and aerial concept sketch:

- ◆ Median trees will not be permitted in the narrow median strips without additional safety provisions. At our meeting we discussed aligning the rail off center to allow a wider one-sided median landscape area.
- ◆ Shoulder areas on Capitol should be delineated.
- ◆ We have committed to improving pedestrian provisions along Capitol, and over the last few years have spent a considerable amount of time and money installing both asphalt and portland cement concrete walks. The LRT work should improve on the sidewalk along Capitol.
- ◆ Trees will not be permitted immediately behind the curb as shown in the sketch. Safety setback will be required.
- ◆ Maintenance of landscaping will need to be resolved. County cannot supply resources for any new expressway landscaping.

- ◆ Prior commitments have been made that LRT will be responsible for improvement of sound walls along Capitol Expressway

We appreciate this opportunity to review VTA's plans for Capitol Expressway.

Sincerely,

Rollo Parsons

Subject: Review of ER-01/0884 NOI for the Capitol Expressway Light Rail Transit
Project in San Jose

Dear Mr. Fitzwater:

In response to your September 18, 2001, Federal Register Notice, the U.S. Fish and Wildlife Service has no comment on the subject document. Please refer any comments to Julie Concannon, Regional Environmental Specialist at (503) 231-2068.

Sincerely,

MADU BACONTE

(1) MS. GOODWIN: Good evening. My name is Eileen
 (2) Goodwin. You are here to hear about the Capitol
 (3) Expressway Downtown East Valley. We do have a meeting
 (4) agenda hopefully everyone had a chance to get the
 (5) packet.
 (6) Does anybody need a packet? I know many of you
 (7) were here earlier and had an opportunity to look around
 (8) of the diagrams. Some of the information that we have
 (9) there is also going to be a power point presentation this
 (10) evening. So if you want to move up. If you can't read
 (11) where you are sitting please feel free to move forward.
 (12) I want to introduce your interpreter Judith. I
 (13) ask if anybody needs interpretive services. If you do
 (14) need the bathroom they are behind you by the exit sign.
 (15) If you haven't had a chance to sign in we would
 (16) appreciate it if you do. So we will put you on our
 (17) mailing list and we are in the process of producing an
 (18) issue of the news letter which is going out at our next
 (19) community meeting.
 (20) Tonight is a formal scoping meeting for the
 (21) environmental process to accept the accumulating
 (22) discussion, which is really more of an opportunity for
 (23) the public to give us input not so much for us to have
 (24) all the answers as a project. We do have a consultant
 (25) working on engineering questions and some of the urban

 (24)
 (25)

(1) planning issues and we'll be having a serious of
 (2) meetings in the next month, end of October and beginning
 (3) of November. We want to make sure that you get a copy
 (4) of that.
 (5) How did you hear about tonight's meeting? How many
 (6) of you got a yellow flyer in the mail?
 (7) And then how about - great. And how about the
 (8) ad in the Mercury News or one of the newspapers? And
 (9) then also I understand that e-mail notification had gone
 (10) out some people at our last week's meeting got the
 (11) e-mail notification. It seems like the flyer was really
 (12) - the flyer in the Mercury were both the two main
 (13) reasons why people heard about tonight's meeting.
 (14) I also want to acknowledge something. Here in
 (15) the meeting Javier Alvarado is from our office. A great
 (16) champion of this project. Javier is becoming a regular
 (17) on all our community meetings to see what the public has
 (18) to say and where the support is and what the issues
 (19) might be to make sure that he's had that directly and
 (20) takes that into account as he makes the policy decisions
 (21) related to this project along with the other members of
 (22) the VTA board. And several of the members of the City
 (23) of San Jose Counsel are also on a Policy Advisory Board
 (24) that gives advice to the VTA board about this project.
 (25) So with that I would like to walk through the

Page 5

(1) agenda and turn the meeting over to the technical people
 (2) who will be your real experts here this evening and then
 (3) we will have a facilitating input session in about a
 (4) half an hour when the formal presentations are over
 (5) because we're such a small group I expect that can be
 (6) very, very informal. Although it says here at the end
 (7) the public comment needs to be on the speaker cards,
 (8) which are these yellow sheets that you've been given.
 (9) If you are more comfortable writing it down and take
 (10) your comment written or if you just like to stick your
 (11) hand up as long as you say your name clearly and speak
 (12) clearly. We are having a court reporter here to
 (13) actually keep formal minutes of this meeting tonight and
 (14) we just need to catch who speak and to get the formal
 (15) record. If you can remember to speak clearly and I may
 (16) even ask you to say your name so I can get all that
 (17) information.
 (18) As you can see we are going to have top
 (19) speakers this evening Tom Fitzwater is the environmental
 (20) planning manager for VTA, and he'll be joined by Gail
 (21) Price, who is project manager for the planning
 (22) conceptual engineer who is as I mentioned will take a
 (23) little less than half an hour we do plan on having a
 (24) break.
 (25) Although again with such a small group we may

Page 6

(1) just have a very short break. And then get right into
 (2) the comments and get you out of here if we are way ahead
 (3) of schedule probably this evening, unless you have a lot
 (4) of comments.
 (5) MR. FITZWATER: On behalf of VTA I would like
 (6) to welcome you to the scoping meeting for the Capitol
 (7) Expressway environmental document. I am the
 (8) environmental planning manager and with me at the desk
 (9) up front is Gail Price. She's the project manager for
 (10) the overall effort for the civil engineering and
 (11) environmental studies that is being prepared. Also with
 (12) us tonight are the environmental consulting firm that is
 (13) involved with helping us prepare the document that
 (14) included Deborah Jones and Mike Davis sitting up front
 (15) and they are also here to listen to your concerns. And
 (16) to ensure that those issues that you raised today are
 (17) addressed in the environmental document.
 (18) What we will be doing is going through a
 (19) presentation on how – on the project as it is perceived
 (20) today and I will talk about the environmental compliance
 (21) process. The purpose of scoping and at the conclusion
 (22) of that and we'll open it up for questions and we
 (23) understand what your issues are. And what your concerns
 (24) are regarding this project.
 (25) And please make sure you sign in so we keep a

Page 7

(1) record of your name. And so you can be informed of
 (2) information for future meetings. And information that
 (3) we shared throughout the duration of this project.
 (4) So with that I'll it turn it over to Gail.
 (5) MS. PRICE: Thank you. My name is Gail Price.
 (6) I am the project manager for the Downtown East Valley
 (7) Project. This project is – is currently within. The
 (8) conceptual engineering phase of the study.
 (9) What you see before you is a map of existing
 (10) and future transit corridors in Santa Clara County. The
 (11) downtown East Valley Project is a portion of the
 (12) improvements that Santa Clara County will be
 (13) undertaking. This project is sponsored by the Valley
 (14) Transportation Authority. And if you look at the map
 (15) you will see that the lower right quadrant is where the
 (16) study area is for the Downtown East Valley.
 (17) The Downtown East Valley study the – what
 (18) predated the conceptual engineering phase was the major
 (19) investment study that was completed in August of 2000.
 (20) And at that time, a preferred investment strategy was
 (21) selected prior to that period of August 2000, 16 or 17
 (22) propositions were examined and the preferred investment
 (23) strategy was preferred as I mentioned in August of last
 (24) year. And that is what – that is the map that you see
 (25) before you. The preferred investment strategy is the

Page 8

(1) Downtown East Valley plan. And it consists of several
 (2) components. Light rail from downtown San Jose or Santa
 (3) Clara/Alum Rock continuing along the Capitol Expressway
 (4) corridor. Another component or element of this project
 (5) is the Monterey Highway element which we'll have a bus
 (6) route transit program. The meeting we will have tonight
 (7) will be focusing on the Capitol Expressway corridor.
 (8) The conceptual engineering for this study is
 (9) being conducted by engineering along the Capitol
 (10) Expressway corridor, which is about eight miles. We are
 (11) proposing approximately 10 stations. And the station
 (12) locations that you will see tonight are as a result of
 (13) the major investment studies. These are preliminary
 (14) station locations. And we are in the process of getting
 (15) community input and conducting technical studies in
 (16) order to determine if these are the station locations
 (17) that will be part of the project.
 (18) The overall project time line the major
 (19) investment study was completed in 2000. We are
 (20) currently in conceptual engineering and we expect that
 (21) work to be done by summer of 2002. The environmental
 (22) analysis is being conducted concurrently and will be
 (23) completed by the summer 2003. Then we will proceed in
 (24) terms of preliminary engineering, final design and
 (25) acquisition. We will anticipate the construction of

Page 9

- (1) this project could begin as late at 2004 or early 2005
- (2) with the construction period of at least three to four
- (3) years, the project process is as I've mentioned before.
- (4) The major investment study was completed in this
- (5) particular graphic. The environmental review should be
- (6) placed underneath conceptual engineering because those
- (7) two elements are being conducted concurrently.
- (8) The conceptual engineering phase will have
- (9) various elements to it. We will look at traffic
- (10) engineering, structural analysis with various structure
- (11) along those lines. The operating plan, station
- (12) location, and design, expensive intercoordination and
- (13) public investment. The next phase of the conceptual
- (14) engineering will include cost estimation for the
- (15) alignment. And continuing environmental review which
- (16) will be discussed later. Refined engineering and the
- (17) implementation plan phase for this project is not
- (18) determined and that will be determined at the end of the
- (19) conceptual engineering process.
- (20) In terms of LRT operation and designs there are
- (21) various considerations, center running or side running
- (22) exclusive or shared right-of-way are being considered
- (23) for various portions of alignment, but in this
- (24) particular area of the Capitol Expressway it will be a
- (25) center running exclusive operation.

Page 10

- (1) The cross section that you see before you is an
- (2) example of the center running, exclusive operation for
- (3) light rail. And you can see in this example that the
- (4) light rail vehicles have their own track way and they
- (5) cannot share that track way with any other vehicles.
- (6) This is an example of light rail operation in
- (7) the center of a road. This is from North First Street
- (8) in San Jose. When we examined the station location we
- (9) considered various criteria and they are noted here.
- (10) Station spacing, the right-of-way impacts, what the
- (11) surrounding uses are currently and proposed, what the
- (12) traffic and parking impacts will be. We are mindful of
- (13) the connections to bus and rail both current and future.
- (14) We are concerned about station access, safety for the
- (15) patrons, station visibility and the support that we have
- (16) on public support and discussion about the project.
- (17) Now, I'm going to very quickly go through the
- (18) portion of the alignment that is not going to be
- (19) discussed tonight in downtown San Jose.
- (20) Okay. The beginning of the station locations
- (21) along the Capitol corridor will begin at the end of the
- (22) Capitol line which is currently under construction. And
- (23) the slide before you shows that the end of the Capitol
- (24) line construction is the end of the dash reline. And
- (25) the end of that particular line will be the Alum Rock

Page 11

- (1) station, which is located in the vicinity of Florence.
- (2) As we continue along the Capitol Expressway in
- (3) the vicinity of Capitol Avenue and Capitol Expressway
- (4) there will be a potential situation and continuing south
- (5) to the intersection of Story. There will also be a
- (6) potential gate of separation at that location.
- (7) The next proposed station location will be at
- (8) Ocala. And the next station location proposed will be
- (9) in the vicinity of Tully and Eastridge. And there will
- (10) be a potential separation in that area as well.
- (11) Continuing south and slightly west, the next station
- (12) proposal location is Nieman continuing to Silver Creek.
- (13) And then the alignment process 101 to Mclaughlin
- (14) continuing to Senter. The next proposed location for a
- (15) station will be in the vicinity of Monterey Highway.
- (16) Continuing west to Vista Park and the next proposed
- (17) location for a station will be at the Guadalupe line
- (18) where the Downtown East Valley line meets the Guadalupe
- (19) line.
- (20) If you would like additional information about
- (21) the Downtown East Valley Project we have a web site,
- (22) downtown east valley at VTA.ORG. I can be reached at
- (23) 321-5744. Thank you.
- (24) MR. FITZWATER: I'm going to talk about the
- (25) compliance process.

Page 12

- (1) And this process really involves compliance
- (2) with rules and regulations, gathering public input, and
- (3) provide decision makers environmental information.
- (4) There are two primarily acts that identify what
- (5) kind of environmental document we need to prepare. And
- (6) they are the California Environmental Quality Act and
- (7) the National Environmental Policy Act. And these were
- (8) both passed in the early 1970s. They helped define the
- (9) information theory required to prepared to address this
- (10) project. There are also various congressional acts and
- (11) the executive orders that deal with specialized issues.
- (12) And we also have to deal with a number of permitting
- (13) agencies that have special interests in resources.
- (14) Here is a list of several of the permitting
- (15) agencies that would be involved with engineer. They
- (16) will have to deal with mitigating that impact to satisfy
- (17) their concerns before a permit would be issued.
- (18) Gathering public input involves a rather long
- (19) process. And the scoping meeting tonight is really the
- (20) first step in that process we have circulated what is
- (21) called a notice of preparation and that provides
- (22) additional preparation in the project that is circulated
- (23) for a 30-day period so we are hoping that people would
- (24) provide their other concerns to us by October 9th.
- (25) We are also circulating a notice of intent,

Page 13

(1) which is a federal process and that also identifies,
 (2) helps, publicized the fact that there is a project being
 (3) considered. In terms of early consultation and
 (4) coordination Gail has already organized a number of open
 (5) houses and community meetings that are going to occur
 (6) over the last couple of months and actually occurred
 (7) prior to this so there is additional opportunity to
 (8) comment.
 (9) We will be preparing a draft environmental
 (10) document. And this will go out for circulation for 45
 (11) days. And that will allow to review the information
 (12) compiled. While the draft of the EIS will be
 (13) circulating we'll hold a public hearing that will be an
 (14) opportunity for the public to voice their concerns or
 (15) submit concerns in writing.
 (16) We will eventually get to a point where we will
 (17) prepare to find an environmental impact report and that
 (18) will include what was prepared as part of the draft plus
 (19) all the comments that were received in response to those
 (20) comments. There is actually time to provide comments
 (21) and that is when this goes to the board of directors,
 (22) VTA board of directors, for their consideration of the
 (23) project.
 (24) To conclude the process we prepare what is
 (25) called a notice of determination and a record of

Page 14

(1) decision. The real purpose of the environmental
 (2) document is to provide a full disclosure of what impacts
 (3) would occur if the project were to proceed, and any
 (4) information needed be to supplied to decision makers
 (5) prior to the making a decision, but it's really not only
 (6) the one. There will be like financial issues and other
 (7) concerns beyond environmental.
 (8) The decision makers in this case are the VTA
 (9) board of directors. And they will be reviewing the
 (10) environmental document. We also have the federal
 (11) transit administration they will review and approve the
 (12) document or ask us to revise the document until they are
 (13) completely satisfied and addressed all the issues.
 (14) Once we get beyond that approval of the
 (15) environmental document we still have to deal with
 (16) regular - regulatory permitting agencies such as those
 (17) that were listed before. We have to satisfy their needs
 (18) before the project could actually begin construction.
 (19) The environmental process does involve a number
 (20) of technical studies. We just listed a few here, there
 (21) is probably close to 20 technical studies which will be
 (22) prepared as part the EIS/EIR.
 (23) The EIR/EIS that we are going to prepare is
 (24) going to comply with most State and Federal requirements
 (25) and if any of you have seen these types of documents

Page 15

(1) they will be very sizeable, and that is required to
 (2) address all the concerns for the public and various
 (3) agencies that have issues that can be addressed.
 (4) Also we do have the potential permits and
 (5) approving that we need to do this actually to have to
 (6) secure these permits as I said before. What we are
 (7) doing today is part of the scoping process. And scoping
 (8) is defined as the process of determining the focus of
 (9) the document of the EIR that is where we are today. Our
 (10) environmental consultants have not embarked upon doing
 (11) detailed analysis as yet. They are waiting to hear from
 (12) us, and hear from you what the issues are and what needs
 (13) to be addressed in the document.
 (14) Scoping initiates the environmental document
 (15) preparation process. It provides an opportunity for the
 (16) public to provide input and it insures that the impacts
 (17) are not overlooked and it also insures important
 (18) mitigation issues are not overlooked and mitigation
 (19) measures are simply conditional steps to try and reduce
 (20) and impact that has been identified.
 (21) In terms of scoping goals we are not concerned
 (22) with ultimate decision. This is not for the project.
 (23) We are simply here to identify what impact would occur
 (24) in the project other than to go forward. Therefore we
 (25) are going to concentrate on the impacts and the

Page 16

(1) mitigation measures to reduce those effects. And we are
 (2) going to ensure that we prepared an adequate document
 (3) that addresses all of those concerns.
 (4) There are a number of environmental issues that
 (5) will be addressed. I'll just touch upon for that or
 (6) some of the more important ones that identify to this
 (7) date those include traffic and parking, noise and
 (8) vibration, visual quality, and economic impacts.
 (9) There is a lot of traffic and parking issues
 (10) that will occur as part of putting light rail in the
 (11) median or side or Capitol Expressway. There will be
 (12) changes in traffic volume and pattern and stations.
 (13) We'll be concerned with pedestrian and bicycle safety.
 (14) We will be looking at impact of key intersections and
 (15) how light rail will affect those intersections. We will
 (16) begin looking at onstreet parking and we will be
 (17) identifying detours and lane closures during
 (18) construction.
 (19) Noise and vibration is also an issue that is
 (20) raised quite frequently in transportation projects with
 (21) the light rail vehicles. We will be looking at train
 (22) bells and horns. We will looking at wheels from squeals
 (23) and this primally occurs at turns of the track. We will
 (24) looking at vibration effect and also construction
 (25) related to noise.

Page 17

- (1) Provisional quality, we will looking at visual
- (2) effects at the stations and overhead catenary system.
- (3) Guadalupe, any of the other locations and the county
- (4) where there is currently operating light rail vehicles.
- (5) We will be looking at visual effects and
- (6) possibly grade separations. And grade separations will
- (7) be location where we think that grade facility would
- (8) interfere usually surround essential traffic
- (9) circulation. We will also be looking at visual effects
- (10) of tree removal and landscaping issues.
- (11) And finally economic issues, we are going to be
- (12) looking at access to businesses during construction,
- (13) access to parking during construction, lack of parking
- (14) due to lack of trains. And as I said there is a number
- (15) of environmental issues that can be addressed as far as
- (16) this document here there is several of the ones that we
- (17) are going to be discussing in the environmental
- (18) document. We want to make sure we have complete
- (19) cooperation.
- (20) The preparation of any EIS and EIR is a long
- (21) process. It's going to take us quite a bit of time to
- (22) come to a conclusion and the scoping meeting tonight,
- (23) but it's going to actually take us 'till the summer of
- (24) this year to get to the point where we have a draft of
- (25) the environmental document that is available for public

Page 18

- (1) review. And that's primarily because consultants have
- (2) to do their analysis and research and review their work,
- (3) and then once we are satisfied with the work efforts we
- (4) have to circulate it to the federal transit
- (5) administration for them to review and be satisfied
- (6) before it actually goes for public review.
- (7) We are looking at a final EIS/EIR some time in
- (8) the spring of 2003 and with a record decision sometime
- (9) in summer of 2003. So this is a long process, this is
- (10) the first opportunity you have to voice your concerns.
- (11) As part of the environmental document. And there is
- (12) certainly additional opportunities as we go through this
- (13) process.
- (14) That concludes the presentation we had planned.
- (15) And you are entitled to take a break, but if you prefer
- (16) to provide your comments now we can go forward and get
- (17) you out earlier.
- (18) MS. GOODWIN: Anybody have any comments, sir?
- (19) Do you want me to read your comments? How do
- (20) you want to do it? Let's see we are so small tonight.
- (21) Do want me to do it? I'd be happy to.
- (22) You are currently thinking on the Nieman
- (23) Boulevard stop versus the stop at Aborn Road. In other
- (24) words, I think the question is are these - where are
- (25) they going to be located? What is was the analysis done

Page 19

- (1) and whether there will be an impact on the transfers
- (2) between Capitol Avenue Expressway and Alum Rock station
- (3) location as of when?
- (4) So - and to begin the fact that we are small
- (5) tonight so do you want to take a stab at it, to put some
- (6) or you can just take it down. I think we don't have a
- (7) lot of people that are going to make comments so you got
- (8) some light to shed I think it's probably appropriate.
- (9) MS. PRICE: Okay. The question is about the
- (10) Nieman Boulevard stop versus the Aborn stop. There a
- (11) lot of factors that were considered in the major
- (12) investment study of the intersections, capacities of
- (13) those intersections what some of the current land uses
- (14) are, so based on some of the technical analysis and of
- (15) the early community input the initial pass on this was
- (16) that Nieman Boulevard stop made some sense in this
- (17) process. During the conceptual engineering we will be
- (18) examining locations and looking at it if there are
- (19) another alternatives that may be make more sense. In
- (20) terms of the transfers you mentioned Capitol line as
- (21) well as the what was the second, Alum Rock? And
- (22) operating plan is being developed in conjunction with
- (23) this project during conceptual engineering, and the
- (24) relationship in the interlining among the various lines
- (25) current in those are being examined as part of the

Page 20

- (1) technical studies.
- (2) AUDIENCE: I guess that station is pretty well
- (3) looked in with a statement of the Capitol line already
- (4) under construction.
- (5) Another station and we are not really at Alum
- (6) Rock some distance away from that one.
- (7) MS. PRICE: You are technically correct.
- (8) AUDIENCE: That says somebody is going to miss
- (9) the connection in the time it takes to go from the exact
- (10) interstate to the station representing that intersection
- (11) to move.
- (12) MS. PRICE: That station there is - there will
- (13) be - it is currently virtually completed. And you are
- (14) quite right technically that is not at Alum Rock but the
- (15) current station name is Alum Rock.
- (16) AUDIENCE: The other thing I read is a station
- (17) that is - I haven't look at it at Bay Point, in
- (18) connection with the Guadalupe. How is that working with
- (19) that?
- (20) MS. PRICE: The Bay Point station has the
- (21) platforms which are located parallel to each other. A
- (22) time determination hasn't been made regarding station
- (23) design location. In the vicinity of Alum station that
- (24) is to examined as part of the technical study of
- (25) conceptual engineering.

Page 21

- (1) MS. GOODWIN: Do have announcement on how it is
 (2) going to work? I think that is part of this gentleman's
 (3) question.
 (4) AUDIENCE: The ability to make transfers
 (5) without missing their – missing their connection.
 (6) MS. PRICE: Did you want to make a comment
 (7) about that?
 (8) SPEAKER: We will be looking at that. We don't
 (9) have any answers, yet.
 (10) MS. GOODWIN: I appreciate it. Any other
 (11) comments that you have or some of the other people.
 (12) AUDIENCE: On the study you made for those
 (13) issues that are raised there a lot of them that are not
 (14) all on the project, right? The time thing you go
 (15) through the process, so you don't to spend an enormous
 (16) amount of time on any specific project on stuff that has
 (17) on the unique consideration like Reid Hillview Airport
 (18) and those high powered tension lines.
 (19) SPEAKER: Those are somewhat unique. It's just
 (20) a since we do have a federal aviation involved. We have
 (21) to make sure that we satisfy their concerns.
 (22) THE COURT: I just want to make sure we capture
 (23) this. Any other thoughts? Other folks who want to make
 (24) a comment for the record. Sir, in the blue. State your
 (25) name for the record, if you would.

Page 22

- (1) MR. CHIVER: Tom Chiver.
 (2) What are we expecting the traffic time to be on
 (3) the Nieman route at Alum Rock to Lawrence to Guadalupe
 (4) Light Rail Station. Can we –
 (5) MS. PRICE: Dennis, I'm going to need a little
 (6) help on this. That travel time to vicinity of Eastridge
 (7) is about – I anticipate about 20 minutes, but from the
 (8) Alum Rock station along the entire Capitol Expressway
 (9) door is anticipated to be approximately what?
 (10) MR. DENNIS: I don't know. I'd be guessing.
 (11) We can provide that information if you would like to, I
 (12) guess e-mail, but it's about eight miles so, in vehicles
 (13) go about 35 miles per hour – per hour I think if I
 (14) believe. So...
 (15) THE COURT: Can I get – what was the other
 (16) one?
 (17) MR. CHIVER: Guadalupe.
 (18) MR. DENNIS: That will definitely be
 (19) information that will be in the environmental document
 (20) which will be available before that.
 (21) MS. GOODWIN: Do you have one of those orange
 (22) cards? Let me give you one. Other comments, questions,
 (23) things to put on record, sir.
 (24) AUDIENCE: Do you have any endangered species
 (25) that are considered endangered that you are aware of?

Page 23

- (1) MS. PRICE: At this point I don't think we are
 (2) aware of any endangered species. Currently we are not
 (3) crossing a lot of creek that could have endangered
 (4) species crossing Coyote Creek, but we are trying to stay
 (5) away from as much as we can. I think in this case it's
 (6) a little simple than in some projects.
 (7) MS. GOODWIN: Anything else?
 (8) AUDIENCE: And this is a question regarding the
 (9) Alum Rock and Story station. You indicated the
 (10) separation. Where would that entire stretch be?
 (11) MS. PRICE: We just started to work with the
 (12) structural engineers on that. So that the stretch in
 (13) the vicinity of Story there is options that are being
 (14) looked at and we are at the beginning of that phase
 (15) right now.
 (16) MS. GOODWIN: Do you have any thoughts about
 (17) that?
 (18) AUDIENCE: Just curious.
 (19) MS. GOODWIN: Any other comments? Well we have
 (20) lots of and lots of cookies for you to take home.
 (21) Please do take some. Maybe take one of the cards with
 (22) you if you think of something you think ah-hah I should
 (23) have asked about that when think about it when I was in
 (24) the shower or whenever fax it in or get it to us via the
 (25) numerous ways that you got the information to do that,

Page 24

- (1) via e-mail or fax or give us a call. And we are taking
 (2) comments through then October 9th.
 (3) So some of your family or other people that you
 (4) know might have questions or comments that will be the
 (5) time to let people get their comments in by October 9th.
 (6) And then as I said please sign up. We can get that you
 (7) number and we'll be doing a lot of community meetings in
 (8) the next couple of months. And we'd like to have you
 (9) come to those that we are going to be interactively.
 (10) Thank you for your time this evening everybody. Thank
 (11) you to Gail and Tom. Nice job.
 (12) (Whereupon, the public scoping meeting was
 (13) concluded at 7:14 p.m.)
